STATEMENT OF QUALIFICATIONS

I, **Geneviève Boudrias**, P.Geo., M.Sc. do hereby declare that:

1. I am a consultant geologist (Geneviève Boudrias, géologue inc.) domiciled at the following address: 5628, Av. Wilderton, Montréal, Québec, H3T 1R9, Canada.

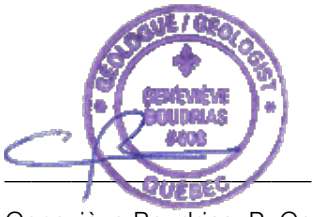
2. I possess the following degrees: a Bachelor`s of Geology (P. Geo) from the Université du Québec à Montréal (1998) and a Master`s of Earth Science (M.Sc.) with a specialization in Geology from the Université du Québec à Montréal (2002)

3. I have been working in the field of geology since 1996.

4. I am an active professional member of the *Ordre des Géologues du Québec* (OGQ, #608) and member of the Association de l'Exploration Minière du Québec (AEMQ).

5. I am responsible for the writing of this report entitled: "NI 43-101 Technical Report on the Willbob Project, Labrador Trough, Quebec" dated 2026-09-10.

6. I have read the definition of "Qualified person" set out in NI 43-101 – Standard of Disclosure for Mineral Projects ("NI 43-101") and certify that, by reason of my education, affiliation with a professional association (as defined in NI 43-101) and past relevant work experience, I fulfill the requirements to be a "qualified person" for purpose of NI 43-101.



7. I visited Willbob site between June 6th and June 14th, 2026.

8. I am not aware of any material facts or material changes with respect to the subject matter of this report which is not reflected in the report that would mislead the reader.

9. I have no interest, direct or indirect, in property and I am independent of the issuer.

10. As of the effective date of the Technical Report and the date of this certificate, to the best of knowledge, information and belief, this Technical Report contains all scientific and technical information that is required to be disclosed to make the Technical Report not misleading.

1 SUMMARY (ITEM 1)

1.1 Introduction

Geneviève Boudrias, géologue Inc. has been retained by Midland Exploration ("Midland") in April 2026 to complete a Technical Report preparing in accordance with National Instrument 43-101 – Standards of Disclosure for Mineral Projects (NI 43-101) pertaining to the Willbob Project ("the Property") located in Nunavik region, Province of Québec. Geneviève Boudrias, géologue Inc. is an independent exploration consulting firm based in Montréal, Province of Québec.

The report, prepared in accordance with NI 43-101 standards, reviews and validates available geological data and summarizes both historical and recent exploration work. The report is based on publicly available information from the Québec Ministry of Natural Resources and Forests and data provided by Midland Exploration, with no confidential information relied upon.

1.2 Property Description and Location

The Willbob Project is in the Nunavik region of northern Québec, approximately 85 km west of Kuujjuaq, which is accessible only by air. The property lies within the Nord-du-Québec administrative region, under the Kativik Regional Administration and the Koksoak River Municipality.

The Property is divided into seven (7) blocks, from north to south: Koksoak, Wayne, Stars, Ants, Kan-Canyon, Didgeridoo-NAK and Oops.

The project, comprising 745 claims covering 34,312 ha approximately 70 km southwest of Kuujjuaq, Québec, is at an early stage of exploration.

The newly acquired Kan Project is subject to a 2% Net Smelter Return ("NSR") royalty in favor of Ressources Tectonic.

Accessibility, Climate, Local resources, Infrastructure and Physiography

The property has no permanent infrastructure and is not accessible by road. Access is primarily by helicopter throughout the year, while floatplanes and boats may be used seasonally in areas with suitable water access. Kuujjuaq serves as the principal logistical support center, providing year-round commercial air service, accommodations, fuel, supplies, communications, medical services, and helicopter charter facilities.

The project area lies within a subarctic climatic zone characterized by long, cold winters and short, cool summers. Snow cover typically persists from October through May, and weather conditions can change rapidly. Exploration activities are generally conducted between early June and mid-October, although helicopter-supported operations may be undertaken year-round.

The physiography consists of gently rolling, glaciated terrain typical of the eastern Canadian Shield. The landscape is characterized by low bedrock hills and ridges, numerous lakes, wetlands, and broad valleys. Elevations generally range from 75 to 300 m above sea level, with drainage controlled by the Koksoak and Caniapiscau river systems, which ultimately discharge into Ungava Bay. Vegetation ranges from boreal forest south of the Koksoak River to shrub tundra and lichen-dominated communities to the north.

1.3 History

Geological exploration in the Koksoak River region began in 1893, when early surveys recognized the area's significant iron potential. Systematic mineral exploration expanded from iron ore in the late 1920s to base metals during the 1950s–1970s, leading to the discovery of numerous deposits. Exploration in the 1980s and 1990s focused on platinum-group elements (PGEs) and iron formation-hosted gold, while the 2000s emphasized PGE-bearing intrusions and orogenic gold systems. More recently, exploration has targeted sediment-hosted Au-As mineralization in black shales and structurally controlled gold associated with diorite and quartz gabbro intrusions.

The first major exploration campaign in the area took place between 1945 and 1956, during which several companies conducted mineral exploration alongside regional geological mapping by the Québec Government. Since 1956, a total of 222 diamond drill holes, totaling approximately 32,300 m, have been completed on or near the Willbob Project.

Following the acquisition of the former Virginia Gold property north of the Koksoak River, Midland renamed the project Willbob and initiated systematic exploration across numerous gold showings.

From 2014 to 2025, Midland's exploration has identified **more than 25 gold showings** across the Willbob Project. Work has progressively advanced from reconnaissance prospecting to drilling, with the **Ants, Didgeridoo, Golden Tooth, Sunshine, Lafrance and Canyon** areas emerging as the principal targets for further exploration.

1.4 Geology

The Labrador Trough is a Paleoproterozoic volcano-sedimentary belt that extends for approximately 1,100 km along the eastern margin of the Superior Province, from northern Québec into Labrador. It forms the western part of the New Quebec Orogen, within the Southeastern Churchill Province, and developed between approximately 2.17 and 1.87 Ga during the opening, sedimentation, volcanism, and subsequent closure of an oceanic basin.

The stratigraphy of the Labrador Trough consists of a thick succession of continental to marine sedimentary and volcanic rocks unconformably overlying Archean basement. The sequence includes quartzites, conglomerates, pelitic rocks, dolomites, iron formations, mafic volcanic rocks, and local felsic volcanic units. These rocks were deposited in evolving rift and passive-margin environments before being deformed and metamorphosed during the Trans-Hudson Orogeny.

During the New Quebec Orogeny (ca. 1.83–1.80 Ga), the Labrador Trough underwent intense compression, producing regional folding, thrust faulting, and major NNW–SSE-trending shear zones. Metamorphic grade generally increases eastward from greenschist facies near the Superior Province to amphibolite and locally granulite facies toward the Core Zone.

The Labrador Trough is internationally recognized for its extensive iron formation-hosted iron ore deposits, but it also hosts significant gold, copper, nickel, cobalt, zinc, and platinum-group element (PGE) mineralization. Gold mineralization is commonly associated with shear zones, quartz-carbonate vein systems, iron formations, and structurally controlled alteration zones developed during the orogenic deformation. Numerous gold occurrences, including those on the Willbob Project, are spatially related to major regional structures and favorable lithological contacts within the western part of the orogen.

The combination of a long-lived tectonic history, diverse lithological assemblages, and regional-scale deformation has made the Labrador Trough one of Canada's most prospective Paleoproterozoic metallogenic belts for both iron ore and orogenic gold exploration.

1.4.1 Mineralization

The Labrador Trough hosts mineral deposits typical of a Paleoproterozoic volcano-sedimentary belt formed along the margin of an eroded Archean continent following crustal rifting. It also contains epigenetic mineralization related to hydrothermal fluid circulation during tectonometamorphic events associated with orogeny, with deposit types comparable to those found in Paleoproterozoic terranes worldwide. According to Richard (2024), the Willbob Project contains approximately 40 gold showings, more than 30 of which were discovered by Midland since 2014. Most are associated with quartz veins hosted in ankerite–chlorite–albite alteration zones within diorite or gabbro, commonly accompanied by pyrrhotite and/or arsenopyrite, with pyrrhotite showing the strongest correlation with high gold grades. Additional gold showings, identified by Osisko between 2013 and 2017, occur in quartz veins cutting carbonate-altered iron formations (e.g., BOMT, Canyon, and Oops). Gold mineralization is also present in volcanogenic massive sulfide (VMS) occurrences, such as the Stars showing.

1.5 Deposit types

Although Labrador Trough is primarily known for iron, VMS, black shale-hosted, and Ni-Cu-PGE deposits, it also has strong potential for orogenic gold mineralization. Favorable geological features include abundant iron-rich host rocks, greenschist-facies metamorphism, polyphase deformation, major crustal-scale structures, and syn-orogenic conglomerates (Richard, 2024, 2025). Orogenic gold is mainly hosted in quartz veins within silicate-carbonate iron formations or differentiated gabbroic intrusions, with mineralization ranging from Au-only to Au-As and polymetallic Au-Ag-Cu-Pb-Zn assemblages (Trépanier et al., 2026).

According to Trépanier et al. (2026), several gold occurrences in the Labrador Trough are hosted in silicate-carbonate iron formations at the contact with metalliferous black shales. The Pump Pad Ridge prospect is a notable example and shares key geological characteristics with the world-class Homestake gold deposit (USA), including a Paleoproterozoic silicate-carbonate iron formation and structurally controlled gold mineralization related to late-stage folding.

1.6 Exploration and Drilling

Since acquiring the Willbob Project in 2014, Midland has conducted multiple prospecting campaigns across its various EER (formerly “claim”) blocks. The most recent exploration programs, completed in 2024 and 2025, focused on prospecting and soil sampling in the NAK area, Didgeridoo block, Jemina showing, and Ants North sector.

The last drilling campaign executed by Midland was in 2019. A total of eleven (11) holes were drilled (WB-19-23 @ WB-19-33) on Ants and Stars showings. The best results are:

- Ants (ddh): 1.81 g/t Au over 12.06 m, including 2.99 g/t Au over 4.56 m in hole WB-19-33 and 2.09 g/t Au over 6.01 m, including 4.05 g/t Au over 2.50 m in hole WB-19-26.
- Stars (ddh): 0.13% Cu / 3.30 m, 0.154 g/t Au, 0.16% Cu over 1.25 m.

1.7 Conclusion

Exploration has identified several high-priority targets across the property. The Ants showing remains one of the primary focuses, where drilling and channel sampling have confirmed continuous gold mineralization from

surface to depth. The Didgeridoo showing also warrants additional drilling following the delineation of a broad gold-mineralized interval.

The Kan-Canyon and Didgeridoo-NAK areas have returned encouraging high-grade gold results and should be advanced through geological mapping, channel sampling, geophysical surveys, and trenching to generate new drill targets. In addition, several underexplored showings, including Golden Tooth, Lafrance, Polar Bear, Sunshine, Wayne, Alias, and Kuurrok, offer further discovery opportunities and should be evaluated through continued prospecting, mapping, structural analysis, and targeted sampling.

These exploration priorities provide a strong pipeline of targets to support future drilling and continued evaluation of the property's gold potential.

2 INTRODUCTION (ITEM 2)

On April 20, 2026, Midland Exploration Inc. (TSX Venture Exchange: "MD" or the "Issuer"), of Rosemère, Québec, commissioned Geneviève Boudrias, M.Sc., Geo. (the "author") and President of Geneviève Boudrias, géologue Inc., to prepare a technical report reviewing and validating all available information pertaining to the Willbob gold Project. The report has been prepared in accordance with the Canadian Securities Administrators' National Instrument 43-101 – Standards of Disclosure for Mineral Projects ("NI 43-101") and the associated Form 43-101F1.

The Willbob Project (the "Property" or the "Willbob Project") is wholly owned by Midland Exploration Inc.

This report summarizes the current exploration status of the Property and reviews historical and recent exploration work completed on the Project. Given the scope of the project, some areas are an active exploration property, but a large portion remains in the grassroots phase. There are no historical estimates about the Property.

2.1 UL ECOLOGO® Certification

In December 2023, Midland obtained UL 2723 ECOLOGO® Certification for Mineral Exploration Companies. This comprehensive certification is the first certification for mineral exploration companies to consider the identification, management, and application of the best environmental, social, and economic practices.

Midland goal is to create long-term value in the mining exploration industry. The Company works in collaboration with all stakeholders to ensure that the principles of transparency and responsibility are respected in all activities. The certification confirms Midland ability to have better relationships with its stakeholders, contributing to the social acceptability of their projects. Additionally, being certified allows Midland to be prepared for possible future changes to the legislation.

For the certification to be granted, companies are evaluated on the following requirements:

- Legal Requirements
- Compliance with Sustainable Design principles along the value chain
- Environmental Quality
- Quality of Life
- Local Investment
- Work Environment
- Business Ethics
- Transparency and Reporting
- Innovation
- Economic Efficiency

2.2 Report responsibility and Qualified Person

This Technical Report was prepared by Geneviève Boudrias, M.Sc., Geo., of Montréal, Québec. Ms. Boudrias is an independent Qualified Person ("QP"), as defined under National Instrument 43-101 – Standards of Disclosure for Mineral Projects ("NI 43-101"), and is responsible for all sections of this Technical Report.

2.3 Terms of reference

The Property comprises 745 claims totaling 34 312.24 ha (343.12 km^2), situated 70 km southwest of the town of Kuujjuaq (Québec). The Property is not encumbered by any royalties, rights of reversion, back-in rights, or payment obligations.

2.4 Sources of information

The author based her report on data, reports and maps extracted from reports available in the public archives of the Ministère des Ressources naturelles et des Forêts du Québec and data provided by Midland.

The author believes that the information provided in these reports is sufficiently accurate for the purposes of this technical report. No confidential data has been provided to the Qualified Person and there is no reason to believe that there is any confidential information to be added to the analysis.

The author is not qualified to comment on issues relating to legal agreements, royalties, permits, taxation and the environment. The authors have relied on representations and documentation provided by Midland.

2.5 Site visit

Site visits completed by the QP are as follows:

- Geneviève Boudrias has visited Willbob Project from June 6th to June 14, 2026.

- The author reviewed selected drill core intervals and associated documentation at the issuer's rental facilities in Kuujjuaq and as well, at the old Kan Camp. During these site visits, the author verified available drill collar locations, conducted data verification activities, including visual inspections of past stripping, channel sampling, and examined diamond drill core from previous drilling programs.

- The author also reviewed drill core logs and corresponding assay results to confirm the accuracy and consistency of the reported exploration data. The author did not collect or verify any samples, nor were any laboratory analyses or tests conducted as part of this review.

2.5.1 Kuujuuaq Core shack

The core for the diamond drill campaign 2016, 2017 and 2019 for the Sunshine, Golden Tooth, Lafrance and Stars showings are stored on the ground of the Land Holding hotel, in Kuujjuaq. The core shack is fenced and locked with a padlock (Photo 1).

Photo 1. Core shack at the Land Holding Hotel, Kuujjuaq.

The Author checked different best intervals core from holes Midland drilled holes, from Lafrance, Golden Tooth and Sunshine prospects.

2.5.2 Old Kan Camp core shack (KAN Block)

The old Osisko Kan Camp has been visited and the best assays core from Osisko, available at this camp has been consulted.

2.5.3 Sites field visit

Several showings located on five (5) of the seven (7) blocks that are part of the Willbob Project were visited:

- Koksoak Block
  - **Golden Tooth**: Showing, channel sampling, old ddh collars
- **Stars Block:** Showing
- **Ants Block:** Showing, channel sampling
- KAN-Canyon Block
  - **Kan Camp**: Core from 2016, 2018
    - **Pump Pad Ridge:** Visit of Winchester sector, striping and channel sampling.

2.6 Units and Currencies

Units in this report are expressed in the International System of Units (SI). Precious metal concentrations are given in grams of metal per metric ton (g/t) or parts per million metal (ppm), metres (m) or kilometres (km) for distance, hectares (ha) for area and square metres (m^2). All currency amounts are in Canadian dollars (CAD), unless otherwise indicated. The abbreviations used in this report are listed in the table below.

The coordinate system used is: UTM NAD 83 Zone 19N.

3 RELIANCE ON OTHER EXPERTS (ITEM 3)

The opinions expressed in this report are those of the authors and are based on their review of the historical work carried out on the Property, as documented in publicly available data.

The Author has relied upon information provided by the Issuer with respect to mineral tenure, option and royalty agreements, environmental liabilities, permits, and other legal matters pertaining to the Property. The Author and Geneviève Boudrias, géologue Inc. are not qualified to provide legal opinions regarding the validity of mineral titles, ownership interests, encumbrances, or potential litigation affecting the Property. Accordingly, no legal opinion is expressed concerning these matters.

4 PROPERTY DESCRIPTION AND LOCATION (ITEM 4)

The Willbob Project is located in the Nunavik region of northern Quebec (**Figure 1**), approximately 85 km west of the community of Kuujjuaq. Kuujjuaq is accessible exclusively by air via its regional airport (YVP).

Figure 1. Location of the Willbob Project, Quebec.

4.1 Location

The Property has a total area of 34,312.24 hectares (343.12 Km^2) and forms seven (7) blocks, with a general north-south orientation.

4.1.2 Administrative Region, Regional County Municipality (MRC) and Municipality

The Property is in the Nord-du-Québec Administrative Region, Kativik Regional Administration (MRC) (RCM or MRC) and, within the Koksoak River Municipality (**Figure 2**).

Figure 2. Administrative division

4.2 Mining Title Status

The mining titles have been verified and validated using “GESTIM” the Quebec government's public register of mining titles and rights operated by the Ministère des Ressources naturelles et des Forêts du Québec. As of April 20, 2026, 745 Exclusive Exploration Right (EER) are registered to Midland Exploration Inc.

The Willbob Project is wholly owned (100%) by Midland Exploration Inc.

Between 2019 and 2024, Midland acquired the EER constituting the initial Willbob Property. In April 2025, Midland acquired the Kan Gold Property from Tectonic Resources Corp., adding 261 Exclusive Exploration Right (EER), covering approximately 121 km², to the existing Willbob Project. As of April 20, 2026, the consolidated Willbob Project comprised 745 map-designated cells (“CDC”) covering a total area of approximately 343.12 km² (**Figure 3**).

The property is organized into seven (7) EER blocks, from north to south: Koksoak, Wayne, Stars, Ants, KAN-Canyon, Didgeridoo-NAK, and Oops (**Figure 3**). The project area is not subject to any known exploration restrictions and lies entirely outside protected areas, including parks and Category I and Category II lands established under the James Bay and Northern Quebec Agreement (**Figure 4**).

Details list of individual EER by number are provided in **Appendix I**, EER by Block in **Appendix II** while EER maps are provided in **Appendix III**.

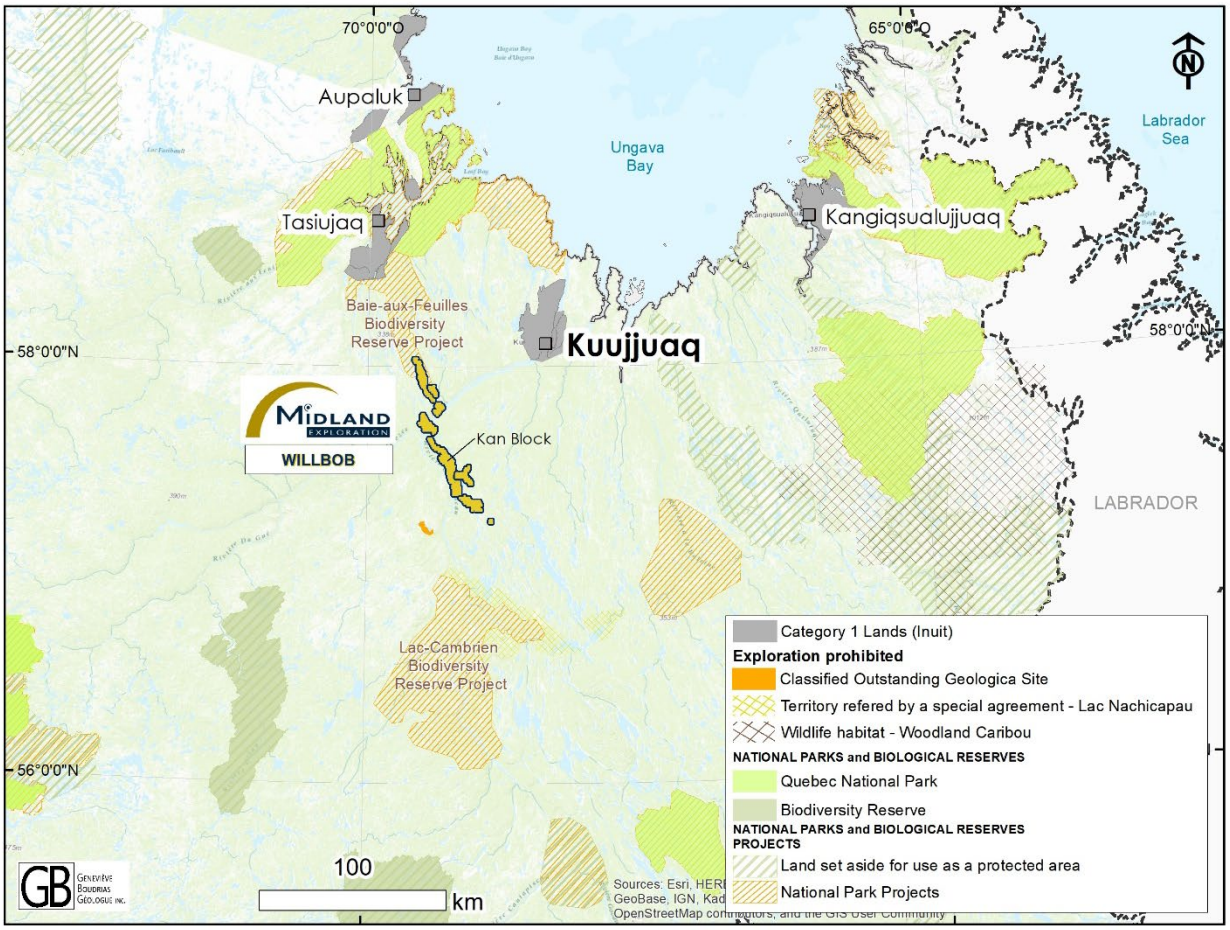

Figure 4. Restricted area

4.3 Nature and scope of the issuer's rights

In Quebec, Mining rights give the holder the exclusive right to explore all mineral substances, excluding oil, gas, brine and surface deposits such as sand, gravel and clay. A Mining right does not confer any surface rights, except for the following rights access for exploration purposes in accordance with the Quebec Mining Act.

For mineral substances, there are two types of mining rights: those authorizing mineral exploration, i.e. “Exclusive Exploration Rights” - EER, CDC - and those issued for mineral exploitation, i.e. “Exploitation Rights”.

The EER for the first renewal period is valid for three years. It is renewable for subsequent two-year periods. It may be renewed after the filing of exploration work reports corresponding to the value required for the amount of work required or, since November 29, 2024, the payment of an amount equivalent to twice the value required for the amounts of work requested provided that 90% of the work credits are available for the claim. The remaining 10% can be paid at double. For further information, readers are invited to consult the Quebec Mining Act, available on the MRNF or Publications Québec websites[1].

4.4 Royalties

The Kan Gold Property is subject to a 2% Net Smelter Return ("NSR") royalty payable to Ressources Tectonic should the Property enter commercial production. Midland may repurchase the NSR royalty in whole or in two 1% increments by making a payment of $1,500,000 per 1% increment to Ressources Tectonic, for a total purchase price of $3,000,000.

Under the acquisition agreement, Midland will acquire a 100% interest in the mining claims held by Ressources Tectonic in consideration of three payments totaling $125,000. The payment schedule consists of $40,000 payable upon signing, $40,000 payable on the first anniversary, and a final payment of $45,000 payable on the second anniversary (Press release dated 2025-04-22). The details of the NSR royalty have not been reviewed by the Author, and therefore Midland has been relied on regarding the applicable NSR royalty.

4.5 Environmental liabilities

The author is not aware of any environmental liability associated with the Property.

Osisko's former Kan camp is still in place but is no longer operational. The consultant is not aware of any environmental issues related to it. The author visited the latter.

4.6 Permit requirements

Forestry work permit

According to Act A-18-1 (Sustainable Forest Development Act), "An intervention permit is required to carry out forest management activities in forests in the domain of the State" (s.73, par.4)- such as wood cutting, etc. and "The Minister may issue a permit authorizing the holder to carry out the forest management activities set out in the permit on the conditions determined by the Minister. However, no intervention permit may be issued to a person who is liable for fees payable under this Act" (s.74).

Act to Amend the Mining Act and Other Provisions – Bill No.63

The **Act to amend the Mining Act and other provisions** was assented to on November 29, 2024. Most of its provisions came into force immediately. The new section 65.1 was deferred to May 30, 2025. Under this provision, Exclusive Exploration Right (EER) holders are required to submit an annual work plan to representatives of any local municipality located in the area of the land subject to the right and, if applicable, to any First Nation or Indigenous community concerned, at least 30 days before the start of exploration work on the land, including aerial geophysical surveys. This obligation is renewed annually as long as the work continues.

ATI - Authorization for impact exploration work

On May 6, 2024, the Ministry of Natural Resources and Forestry introduced a new prior authorization requirement for all impact exploration work (ATI) such as excavation, rock stripping, bulk sampling, drilling survey, refraction seismic geophysical surveys and work carried out with a hydraulic pump for gold panning purposes. This authorization is governed by the provisions of Sections 69, 69.1 and 69.2 of the Act and Sections 11, 12 and 13 of the Regulation.

4.7 Additional factors

4.7.1 Mining restrictions affecting the property (GESTIM, 2026, MELCCFP, 2026)

The GESTIM web site consultation identified no constraints to mining activity that affect the Property (Figure 4).

A proposed park area is located adjacent to the Koksoak Block and encompasses its northern sector.

It should be noted that an eagle nest had previously been reported in the Ants sector. However, following a validation inspection conducted on June 11, 2026, no eagle presence or associated nesting activity was observed. This information was subsequently communicated to the wildlife authorities.

Had an active eagle presence been confirmed within the area, a mitigation measure would have been implemented requiring all aerial operations to maintain a minimum setback distance of 700 m from the nest in order to minimize potential disturbance to the species.

5 ACCESSIBILITY, PHYSIOGRAPHY, INFRASTRUCTURE AND CLIMATE (ITEM 5)

5.1 Accessibility

The Property is accessible year-round by helicopter. During the summer season, access may also be facilitated by floatplane and boat in areas where suitable water bodies are available.

Logistical support and accommodation services are provided from the town of Kuujjuaq, located approximately 85 km east of the project area (Figure 5). Kuujjuaq serves as the principal regional service center and is equipped with a full-service airport supporting daily commercial passenger and cargo flights.

The airport, which is operated year-round, accommodates scheduled and regular passenger and cargo services connecting the region with southern Quebec, primarily from Montréal, and other Nunavik communities, providing reliable year-round access for personnel, equipment, and supplies. Helicopter and fixed-wing charter services are also available from Kuujjuaq to support exploration activities in remote areas.

Kuujjuaq serves as the main regional logistics hub, providing essential services supporting mineral exploration and development activities in the Ungava Bay region.

Figure 5. Accessibility

5.2 Weather

The project area is characterized by a subarctic climate typical of the Nunavik region of northern Quebec, characterized by long, cold winters, short cool summers, and rapid weather changes. Seasonal snow covers, freeze-thaw processes, and fluvial erosion continue to influence modern landscape development. Permafrost is discontinuous in the southern portion of the region and becomes more continuous northward.

Climatic conditions generally constrain field operations to the period between early June and mid-October. Weather conditions can change rapidly, with favorable conditions transitioning to cold, windy, fog and rainy weather within a matter of hours. Mean daily temperatures range from approximately -23°C in January to 12°C in July[2] (Figure 6).

[2] https://climat.meteo.gc.ca/climate_normals/results_1991_2020_f.html?searchType=stnName_1991&txtStationName_1991=kuujjuaq&searchMethod=contains&txtCentralLatMin=0&txtCentralLatSec=0&txtCentralLongMin=0&txtCentralLongSec=0&climate_id=7113534&dispBack=1

Annual precipitation averages approximately 650–750 mm, with snowfall accounting for a significant proportion of total precipitation.

Meteorological data from Kuujjuaq are considered representative of conditions within the project area.

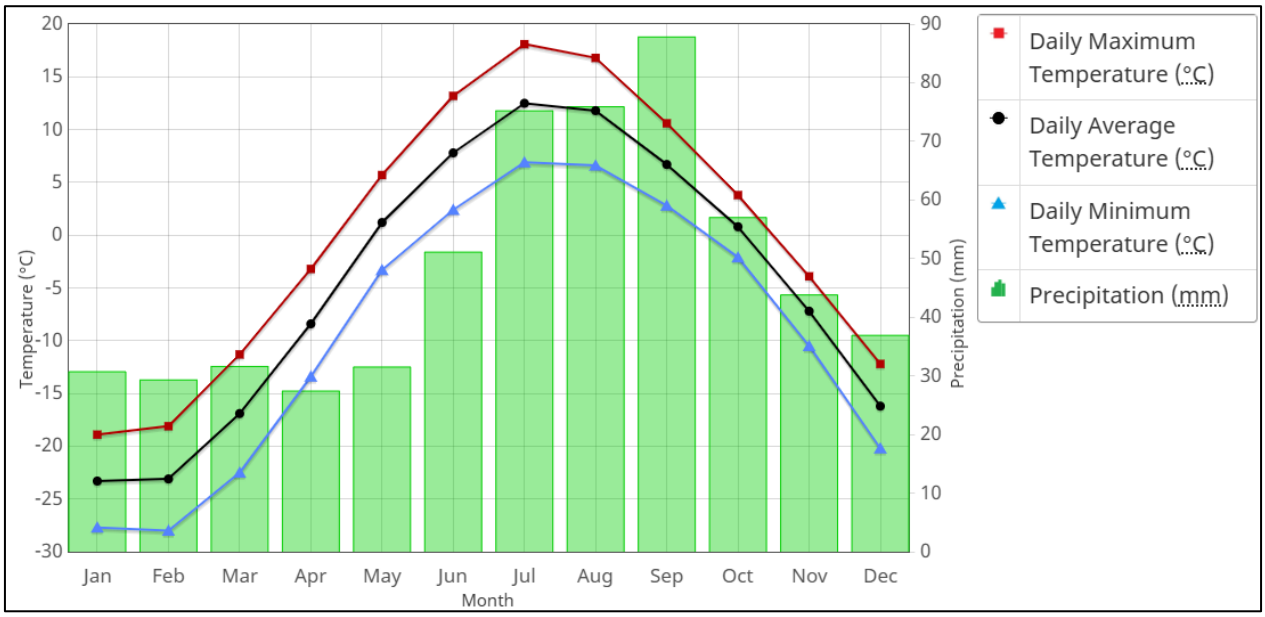

Figure 6. Temperature and Precipitation Graph for 1991-2020 Canadian Climate Normals, Kuujjuaq (Source: https://climate.weather.gc.ca/climate_normals/).

5.3 Local Resources and Infrastructure

The Willbob Property is not supported by any permanent on-site infrastructure. The exploration camp previously utilized on the Kan Property has been decommissioned. No road access exists within or adjacent to the Property, and access is primarily by helicopter.

The community contains a range of commercial and public services, including hotels, restaurants, grocery stores, fuel distribution facilities, equipment suppliers, medical services, government offices, and communications infrastructure. These facilities provide an established support base for exploration and seasonal field operations throughout the region.

Electrical power within Kuujjuaq is supplied through a local generating station operated by Hydro-Québec. Telecommunications services, including cellular and internet coverage, are available within the community. Seasonal marine resupply is conducted via the Koksoak River and Ungava Bay, although air transportation remains the primary means of year-round access for both the community and surrounding exploration properties.

Given its strategic location, transportation infrastructure, and availability of commercial services, Kuujjuaq represents an effective staging area for mineral exploration and development projects within the central Ungava Peninsula.

5.4 Physical geography

The Kuujjuaq region is situated within the eastern portion of the Canadian Shield, near the transition between the boreal forest and tundra biomes of the Ungava Peninsula. The landscape is characterized by a gently undulating to rolling topography composed of low bedrock hills, ridges, and broad glacially sculpted valleys, that generally follow a north-northwest to south-southeast (NNW–SSE) orientation, reflecting the regional structural fabric of the Labrador Trough. Regional relief is generally moderate, with elevations commonly ranging from 50 to 300 m above sea level (ASL) with typical elevations ranging between 200 and 250 m ASL.

The physiography reflects extensive Pleistocene glaciation and is characterized by abundant glacial and post-glacial landforms, including exposed bedrock outcrops, till-covered uplands, eskers, moraines, wetlands, and numerous lakes and ponds. Surface drainage is generally poorly integrated due to the abundance of depressions and water bodies typical of the Canadian Shield terrain. Surface drainage is directed toward Ungava Bay through the Caniapiscau and Koksoak River systems.

Vegetation north of the Koksoak River is typical of tundra environments and consists predominantly of lichen communities, heath, and moorland vegetation, with localized willow thickets. Shrub vegetation and scattered coniferous trees become more common within valleys and along major drainage corridors. South of the Koksoak River, boreal forest vegetation predominates, characterized by extensive stands of black spruce, larch, and alder. Wetlands, shrublands, and sparsely treed areas are common throughout the landscape (Figure 7).

Wildlife within the project area is representative of the subarctic environment and includes caribou, wolves, snowshoe hare, Arctic fox, and black bears.

6 HISTORY (ITEM 6)

6.1 Regional history

From Richard (2025), reconnaissance geological investigations in the Koksoak River region were first conducted by Albert Peter Low of the Geological Survey of Canada in 1893 (Low, 1896). During these early surveys, Low documented prominent geological features, including Pyrite Falls and Limestone Falls, and recognized the region's significant iron potential (Low, 1896; Leigh, 1970).

Systematic mineral exploration within the Labrador Trough began in the late 1920s, driven by the discovery of large iron ore deposits in its southern sector near Schefferville (James and Gill, 1929; Tremblay and Théberge, 2014). Exploration efforts subsequently expanded to include base metals, with the potential for Zn-Cu-Pb and Cu-Ni mineralization becoming evident.

This led to an intensive exploration period throughout the 1950s, 1960s, and 1970s, during which most of the currently known base-metal deposits and showings in the region were discovered (Trépanier, 2001).

During the 1980s and 1990s, exploration activities shifted toward platinum-group element (PGE) mineralization and gold hosted within iron formations (Trépanier, 2001). Exploration programs in the 2000s continued to focus primarily on PGE mineralization associated with gabbroic intrusions, as well as orogenic gold systems. In the 2010s, black shales were recognized as both potential sources and traps for sediment-hosted Au-As mineralization (Hébert et al., 2014). Concurrently, structurally controlled gold mineralization associated with diorite and quartz gabbro units was identified as a promising exploration target and subsequently worked (St-Cyr, 2016).

6.2 Willbob - Historical Exploration Activities

After Low expedition, the first work by a company was done in 1929.

1929 **Quebec Labrador Dev.** Recognition of the Kaniapiscau geological Group and different types of iron formation. James et Gill, 1929; GM 08390

While exploring for Superior-type iron deposits in the Koksoak River area, several companies recognized the potential for Cu-Ni mineralization within leopard rock, a lithology formerly described as blotchy gabbro and currently referred to as glomeroporphyric gabbro. Richard, 2025; GM 74383

1936 **Fenmore Iron Mines**. Sampling survey and map location. GM 01936

The period from 1945 to 1956 marked the first significant exploration campaign in the area, with several companies undertaking mineral exploration activities while the Quebec Government completed regional geological mapping. Sauvé, 1956; RP 325

Since 1956, a total of 222 ddh for a total of 32,300 m were drilled on and the vicinity of Willbob Project and this excludes the drilling west of the Koksoak Block for Ni-Cu in mafic volcanics (403 ddh) (Richard, 2025). **Table 2** shows details and main results for each drilling campaign and **Appendix IV** shows the location of the historical holes.

1945 **Frobisher Expl Co Ltd**. Detailed microscopic study. Geological map. GM 01199

1947 - 1948 **Quebec Labrador Dev. (Kan Block).** Airborne Geological survey. Low, 1947; GM 00960
Exploration for Iron Formation and mapping along the Koksoak River. Drilled five (5) packsack holes (Kan actual property). Wahl, 1948; GM 00393

1953 **Bergeron and Harquail.** Study about Iron Formation exploration. The authors present various indicators for iron deposits in the region, especially from Frobisher Ltd. and the Quebec Department of Mines. GM 18664

1954 - 1956 **Hollanah Mines**. Numerous copper showings were identified in gossanous outcrops of pyrrhotite-chalcopyrite-bearing glomeroporphyritic gabbro in the southwestern part of the Stars Block, particularly in the vicinity of Erickson Lake. These include the Erickson #4 Lower Gossan and Upper Gossan (Pillow Lake) occurrences described by Bostock (1954).

Geological survey and mapping between the Erickson Lake – Now called Livaudière Lake and the Koksoak River. GM 03053, GM 04708

Mag Geophysical survey on Erickson No4 claims. Grid: 22,000' (6.7 km) lines. GM 03908-A, GM 03909-B

Drilling: Three (3) holes totaling 1221 ft (372.2 m) on the Stars Block. The assay results were embedded in the logs but are hidden. GM 03909-C

Six (6) backpacking holes were drilled totaling 300 ft (91.4 m) in the main Gossan zone. There is no analysis included in the report. GM 03908-B

1956 - 1957 **Silver Miller Mines Ltd.**, **Lagava Minerals Ltd.** Gerido Lake Claim Geological survey, mapping and prospecting. No assay results are reported.

Drilling: Eleven (11) ddh in south of Koksoak River. GM 04787-A

1955 - 1956 **Quebec Department of Mines**. Evaluation of different Iron Formation projects and geological survey on the Gerido Lake and Leopard Lake areas. GM 17506, RP 0309, RP 325

1957 **Hard Rock Gold Mines**. Geological mapping south of Erickson Lake, drilling and geophysical survey on Gerido Lake area. Four different types of mineralization are known to occur in this area: 1- Mineralization associated with the blotchy gabbro, 2- Mineralization associated with the gabbro sedimentary contact, 3 - Mineralization associated with shear zones, 4 – Magnetite in the Sedimentary rocks. GM 03730-A, GM 3730-B

Drilling: Eighteen (18) ddh (1 @ 18).

1961 - 1963 **Telstar Metals Mines. Claims Boylen.** Abner showing, Koke (Kola) showing. The company proceeded with trenching (13), geological mapping and diamond drilling surveys (30 ddh; 11,028 ft (3,361.3 m). A Magnetic survey (70 miles (112.65 km)) and EM survey (34 miles) were executed, and all indicated a zone of magnetic and conductive rocks. The zone consists of iron and carbon-rich sandstones, quartzites and dolomites. GM 17613, GM 13334-A, GM 13334-B

1964 - 1966 **Cominco Ltee.** (**Kan Block**) Exploration of massive sulphide over the Kan Property. Several massive sulphide boulders were found (0.13% Cu, 8.0% Pb, 10% Zn, 8.0 oz/t Ag) by prospection. Soil and geophysical survey were done. **Results**: Discovery of the Kan showing. Fifty-five (55) claims were staked – Kan property. GM 32117

Drilling: Five (5) ddh totaling 186 m on the Kan showing (Main showing). Drill logging recorded several quartzite intersections containing an estimated 50–55% sulfides, consisting of pyrite, pyrrhotite, sphalerite, galena, and chalcopyrite. The best intersection was 4 feet of 5.2% Zn, 2.6% Pb and 2.8 oz/t Ag (GM 32117). No assay results are available to confirm the presence or grade of mineralization. The property was abandoned. GM 18056

1964 - 1995 The **Quebec Department of Natural Resources and the IREM-MERI** carried out geological mapping, regional surveys, and structural and mineralization studies in various parts of the Labrador Trough.

These programs were undertaken to improve the geological understanding of the region and to support the assessment and development of its mineral resource potential. RP 524 (1964), RG 104 (1965), DP 179 (1968), ES 005 (1970), DP 269 (1974), DPV 452 (1977), DPV 568 (1978), DPV 663 (1979), DPV 666 (1979), DPV 781 (1980), DPV 835 (1981), DPV 929 (1982), DP 86-26 (1986), DP 87-14, PRO 87-04 (1987), PRO 87-18 (1987), MB 87-19 (1987), MB 87-21 (1987), ET 87-13 (1987), DP 87-14 (1987), MB 88-05 (1988), MB 89-25 (1989), MB 91-10 (1991), MB 95-36 (1995)

1971 - 1972 **Imperial Oil Enterprises, Claims Gordon**. Soil survey, prospection and airborne Mag and EM geophysical surveys in the surroundings of the Koksoak and Sitturaviup rivers. After these works, it was recommended that no work be done on the property next season. GM 28209, GM 28210, GM 29183

1972 - 1973 **Hollinger North Shore Expl**. Works in the Sitturaviup river area.

Drilling: Eleven (11) ddh (72M-1 @ -11) totaling 4,379 ft (1,335 m) in the Rivière Sitturaviup area (Mercier River), to test Mag and EM geophysical anomalies (aerial and ground survey) north of BOMT ("Baby One More Time") showing. Drilling intersected intervals of massive sulfides within sedimentary sequences, as well as disseminated sulfides hosted in gabbro and leopard rock (blotchy gabbro also called glomeroporphyric gabbro) units. GM 28863

1976 **Cominco Ltee. (Kan Block)**). Continue to work on the Koke project (Kola property), staked from Boylen Energy in 1974. Drill indicated reserves are 1.2 mt @ 0.7% Cu, 6.9% Zn, 1% Pb and 1.6 oz/t Ag to a depth of 550' (167.6 m). **Cominco has re-acquired the Kan property** after it had been abandoned. Soil, stream sediments, water and grab samples survey were done as well as a ground geophysic surveys (EM, Mag, Gravity). GM 32115, GM 32117, GM 32180

1987 - 1989 **Noranda Exploration Ltee. Lake Dupuy East showing** (Koksoak Block). Exploration of Au+GPE in Gabbro and Iron formation**.** Acquires three exploration permits east of Pyrite Falls to north of the Situraviup River. **Discovery of the Rougemont Lake** (Dessureault showing)**.** Different surveys as well as geophysical surveys (VLF-EM and HLEM) and drilling were executed over the Fort Chimo project on the Lac St-Pierre property targeting the Platine Group Elements (PGE). After these works, Noranda abandoned the project. **Results:** discovery of showings such Noranda Ridge (**Kan Block**). GM 46467, GM 46922, GM 47118, GM 48559, GM 49488, GM 47542, GM 47546, GM 47548, GM 49051, GM 49052

Lac St-Pierre Property - Lac Rougemont (Dessureault) – (Koksoak) (1988)

Stripping: A gold anomaly zone located at L800N/500W was stripped using a water pump ("Wajax") over 50 m by 10 m.

Channel sampling: The few anomalous gold values obtained confirm its close association with quartz veins: 4.39 g/t Au over 45 cm, 11.98 g/t Au over 25 cm, 7.63 g/t Au over 22 cm, and 12.66 g/t Au over 7 cm (RLR-1 to RLR-12 and RLR-13 to RLR-21). These channels were analyzed for gold at the Chimitec laboratory in Quebec City using pyroanalysis/atomic absorption, considering coarse gold. The fraction larger than 150 mesh was therefore also analyzed, and a weighted average of the two values was calculated for each sample, yielding a more representative "average Au" value. GM 49053

Soil and till sampling: The purpose of the first survey was to cover an area of the fold's crest where the rock outcrops sparsely: Seventy-six (76) samples were collected at the base of the till. Gold was detected at two locations, two clusters of four or five anomalous samples. The second survey,

northern extension, sampled two or three horizons for each borehole. Eighty (80) samples were collected and analyzed for Cu, Pb, Zn, Ag, Au, and As. No significant anomalies.

Grab sampling: More than 330 grab samples were taken on a grid. Only a few samples yielded gold values greater than 500 ppb outside the anomalous zone.

Drilling:

- 1988 Seven (7) shallow ddh (88-LR-1 @ 88-LR-6, 88-LR05B) totaling 406.5 m on the Lac Rougemont (Dessureault) area consisting in a-up follow-up on good channel sampling. Only hole 88-LR-2 (4.1 g/t Au over 7.6 m incl. 7.0 g/t Au over 2.8 m) appears to have intersected the surface-discovered mineralized zone. GM 49053
- 1988 Two (2) ddh (88-LSP-1, 88-LSP-2) were drilled. The 88-LSP-1 hole intersected a zone approximately 20 m long that is rich in sulfides, containing 25 to 40% pyrrhotite. The only anomalous gold values obtained came from the beginning of this zone, yielding a section of 1.78 g/t Au over 1.80 m. GM 49488
- 1989 Twenty (18) ddh (44-89-7 @ -15) on the Lac Rougemont (Dessureault) showing. The aim was to test the gold potential. GM 49486

Pyrite Falls Showing (Kan Block): Discovered in 1987 by prospection. Grab: 15 g/t Au. The year after, drilling, stripping, channel and till sampling were undertaken. Results: 10.35 g/t Au over 2.1 m and 6.41 g/t Au over 3.3 m. geological mapping @ 1:2500, trenching and channel sampling VLF-EM, magnetic and HLEM surveying.

Drilling: Nine (9) holes (45-89-1 @ 45-89-9) and 346 metres of core. Two (2) ddh intersected a small, gold-rich horizon near the surface, associated with quartz-carbonate-pyrrhotite and chlorite veins and veinlets crossing the iron formation. Results: 22.2 g/t Au over 0.75 m and 6.3 g/t Au over 1.55 m in hole 45-89-01 and 17.8 g/t Au over 0.75 m in 45-89-04. GM 49487

1993 - 1997 Kennecott Canada Inc. (Kan and canyon Block) Exploration for Zn-Pb-Cu + Au in the Baby Formation and Iron Formation. The Company continued exploration of the Kan project following the cessation of exploration activities by Noranda. Regional reconnaissance, soil survey, stream sediment survey, pionjar overburden drilling (Chain Lake area), detailed mapping at Chain Lakes area, Twilight showing, Ferricrete showing, Baby showing and Kan showing and drilling survey totaling 2401m. Geophysical survey including gravity and ground mag survey were executed. GM 52215

Drilling: Kan property. In 1994, drilled sixteen (16) holes (K94-01 @ K94-16) totaling 2,400.9 m on the Kan-KTR-Pump Pad Ridge and on Ferricrete showings. Drill hole K94-16, which recorded an intercept of 80 m averaging 1,300 ppm zinc, including 32 m of 2,072 ppm zinc. No ore-grade massive sulphide mineralization was intersected. Result: Discovery of the Ferricrete showing. GM 52658, GM 53513

In 1995, a total of 1,483 m was drilled in six (6) holes (K95-17 @ K95-22). Holes K95-17 to 20 all intersected significant intervals of Zn mineralized graphitic shale (44 m averaging 1987 ppm Zn in hole K95-17). GM 54102

In 1996, fourteen (14) shallow ddh (K96-1 @ K96-14) totaling 1,615 m were drilled on the Ducreux Lake area in the aim to test the prospective graphitic shale horizon. Results: 6 m of 0.5% zinc and 5 g/t silver. No ore grade intercepts were encountered. GM 54988

1998 – 2000 Noranda Inc. (Kan Block) Exploration for Zn-Pb in Dolomite and for gold (regional). Between 1998-2000, geophysical surveys (such ground EM, ground gravimetry and mag), geochemistry surveys,

soil survey, regional hyperspectral survey and drilling survey were undertaken over the Kan Property. The drilling program was designed to identify the source of approximately 30 massive Zn-Pb-Ag sulfide boulders, which averaged 7.7% Pb, 9.75% Zn, and 276 g/t Ag, and to evaluate the Pb-Zn Kan massive sulfide showing and to test geophysics anomalies. GM 49486, GM 60771

Drilling: Seven (7) ddh (KE-99-01 @ KE-99-07) totaling 1,685 m, were drilled on the Kan, Abner S-SE and Koke showings.

Results: Kan: Sphalerite veinlets are visibly late developing. Values of 0.24% Zn /1.0 m and 0.39% Zn / 0.9 m were obtained.
Koke: A horizon of massive pyrite sulfides was intersected from 262.0 m to 262.9 m but was depleted in base metals.
Abner Sud: KE-99-01 DDH yielded 0.84% Zn / 3.0 m, including 2.45% Zn /0.8 m. A value of 3.52% Zn / 0.9 m was obtained in KE-99-02. GM 57912

Drilling: In 2000, twenty (20) ddh (KE-00-8 @ KE-00-27) totaling 3,978 m were drilled on the Kan, Abner S-SE, Koke and Riviere Showings. GM 58601

Results: Kan: The best value obtained was 10.8% Zn, 7.4% Pb, 270 g/t Ag and 0/6 g/t Au over 0.25m.
Koke: No good results, recommendation to pause the project
Abner: Small amounts of zinc mineralization were intersected.
Riviere: 1.3% Zn / 10.4 m, including 4.23% Zn / 1.2 m, in borehole KE-00-26.

2000 - 2014 **Virginia Gold Mines Inc**. (**Didgeridoo, Ants Blocks**) Exploration for Zn-Pb in Dolomite and for gold (regional). Worked, consisting of rock and till sampling on two projects: actual Didgeriddo Block and the Pyrite Falls area. Exploration in the surrounding of the Lac Lauzon, south of the Koksoak River within in a partnership with Altius Minerals Corp. The property was abandoned in 2014.

Results: DJ and Rivière Koksoak showings were found (2.94 and 1.2 g/t Au). GM 59010, GM 67961

2000 - 2004 **Nunavik Mineral Exploration Fund (NMEF)**. (**Stars, Koksoak Blocks**). Discovery of the Stars showing (2000), (2.94 and 1.2 g/t Au). The Lafrance showing (between 1.1 and 7.4 g/t Au) and Polar Bear showing are also found. In a JV with Virigina, they found also Smoking Bear and Kuni showings. Ref.: GM 69328

2000 - 2024 **MRNF** published a lithotectonic and metallogeny synthesis written by Wares and Clark, 2005. This paper remains of very good quality and is still used as a reference in the Labrador Trough today. MM 2005-01

2007 - 2012 **Ressources Tectonic Inc., Rio Silver Inc., Everton. (Kan Block)** Geological compilation on the Ferricrete showing. Aeroported EM and Mag geophysical surveys, geochemistry surveys and drilling were conducted on the Kan property. GM 62835, GM 64286, GM 64287, GM 66257, GM 66258, GM 67824

Drilling: A total of 1,220.42 m of BTW size diamond drilling was completed over 5 holes (KA12-001 @ KA12-006) (1 abandoned) on the Pump Pad Ridge and Abner Sud showings. **Result**: Discovery of Pump Pad Ridge by drilling: returned 1.2 g/t Au over 10.42 m in drill hole KA12-002 and, Discovery of KTR1. GM 68022

2015 – 2019 **Minière Osisko, Osisko Baie-James SENC**. (**Kan Block**). Between 2015 and 2019, prospection, soil survey (2,052 samples), trenches, drilling and high-resolution helicopter-borne magnetic survey were executed on the **Kan Property**, on the Pump Pad Ridge, Ferricrete and Pyrite Falls showings. The best sample (soil) raised 3,430 ppb Au 3 km south of BOMT showing that lead to the Canyon showing discovery in 2019. In 2019, the company let go of the claims surrounding the BOMT showing. GM 70234, GM 70728, GM 70729, GM 70730

Drilling : **2016**. Eleven (11) ddh were drilled (FAU-16-001 @ FAU-16-011) on Pump Pad Ridge and Ferricrete showings. **Results**: The best result were returned from FAU-16-001 with 2.13 g/t Au over 8 m including 5.3 g/t Au over 2 m and from FAU-16-002 with 4.62 g/t Au over 8 m including 16.2 g/t Au over 2 m (**Figure 8, and Figure 9**). 2023 - 2024 **Ressources Tectonic Inc. (Kan Block)**. Prospecting campaign to locate a massive sulfide block discovered in 2011 and to determine whether it originated from a local source, south of Pyrite Falls sowing. In 2024, one hundred and fourteen (114) rock samples were sent to the laboratory. A total of 78 soil samples were sent to the laboratory. GM 74122

Results: Two (2) samples returned very high gold values (39.5 and 26.5 g/t Au), 4 returned high gold values (between 2.96 and 9.85 g/t Au).

6.2.1 Midland Exploration works

2014 **Midland acquired the property abandoned by Viriginia Gold**, north of the Koksoak River, the project is now called **Willbob Project**. The **Lafrance** showing is re-visited: GM 69328

Results : Grab samples : 5.44 g/t Au (R128716), 4.79 g/t Au (R128715), 2.44 g/t Au (R128714), 2.12 g/t Au (R128717).

2015 Exploration on **Lafrance, Kuni, Kuni Sud, Dupuy, Golden Tooth, Polar Bear areas**. Grab sampling, channel sampling and Mapping were completed.

Results: Grab samples: 77.6 g/t Au (R147117)(Kuni Sud), 25.2 g/t Au (R147992)(Golden Tooth) and 4.46 g/t Au (R146913) (Ulu) (MD Press release) and from channel sampling: 4.1 g/t Au over 0.5 m at Polar Bear, 1.68 g/t Au over 3 m at Golden Tooth and 0.467 g/t Au over 0.25 m and 0.448 g/t Au over 0.40 m at Kuni.

2016 – 2017 Twenty-three (23) holes (WB-16-001 @ WB-16-022, -020A and -020B) were drilled totaling 3,128 m on the Koksoac Block, **North, Golden Tooth, Polar Bear, GTN-4, Sunshine, Kuni, Kuurok** and **Stars** showings. Discovery of the **Didgeridoo** showing. A high-resolution Airborne geophysical survey was executed. A total of 964 grab samples were taken in 2016: 10 returned very high gold values (over 10 g/t Au), 27 returned high gold values (between 2 and 10 g/t Au), 51 returned gold values (between 0.5 and 2 g/t Au). Channel sampling was also done.

In 2017, 1,143 grab samples were assayed. Eleven (11) returned very high gold values (over 10 g/t Au), 22 returned high gold values (between 2 and 10 g/t Au), 40 returned gold values (between 0.5 and 2 g/t Au). Channel sampling on Didgeridoo: 1.37 g/t Au over 6.10 m. Fourteen (14) DDH were drilled for a total of 3,534.4 m on Golden Tooth (3), GTN-4 (1) Kuurok (1), Polar Bear (1), Sunshine (1), Kuni (1), Stars (3). GM 69661, GM 70444, GM 70639, GM 71411

Results:
Golden Tooth (ddh): 1.28 g/t Au over 6.35 m, 2.14 g/t Au over 1.5 m, 2.23 g/t Au over 1.25 m, 1.12 g/t Au over 3.65 m
Kuurrok (ddh): 3.5 g/t Au over 0.35 m
Sunshine (ddh): 36.4 g/t Au over 0.35 m, 1.99 g/t Au over 0.45 m
Lafrance (ddh): 1.62 g/t Au over 1m, 1.189 g/t Au over 4.6 m
Polar Bear: 0.73 g/t Au over 2.7 m, including 1.2 g/t over 1.3 m
Dessureault (1980) replica (channel): 6.9 g/t Au over 3.9 m
GTN-4 (channel): 1.9 g/t Au over 2 m, including 3.48 g/t Au over 1 m

New showings:
2016: PBN, Sunshine, Tip Zone, Y Zone, Terrier, Dragon Lake, GTN and Lafrance East
2017: Alias, Wayne, Kavi, SP, Serpent, Cross Lake, Lac H, West Smokey Bear, Didgeridoo and NAK.

2018 **Discovery of Ants showing** (2.94 and 1.2 g/t Au). Trenching, grab sampling (597 samples): 2 returned very high gold values (over 10.0 g/t Au), 6 returned high gold values (between 2 and 10 g/t Au), 18 returned gold values (between 0.5 and 2 g/t Au). GM 71491

Results:
Ants (channel): 1.48 g/t Au over 2.8 m (Ants-18-01), 3.33 g/t Au over 5.0 m (Ants-18-02) and 1.78 g/t Au over 23.3 m, including 3.19 g/t Au over 10.0 m (Ants18-03).
Didgeridoo (channel): 2.30 g/t Au over 8.95 m, including 3.56 g/t Au over 3.15 m (DJ-18-05).

New showings: Romeo, Janet, Ants and Ants-4g

2019 **Midland acquired the claims of BOMT dropped by Osisko**. A total of eleven (11) ddh (WB-19-23 @ WB-19-33) were drilled on Ants and Stars showings. The objectives were to test the extensions of the Ants gold zone characterized in surface by channels (1.78 g/t Au over 23.3 m, including 3.1 g/t Au over 10.0 m). Define the known Stars massive sulfide 50 m below the zone intercepted in 2017. Soil survey was undertaken. Three hundred fifty-two (352) grab samples were taken. GM 72183

Results:
Ants (ddh): 1.81 g/t Au over 12.06 m, including 2.99 g/t Au over 4.56 m in hole WB-19-33, 2.09 g/t Au over 6.01 m, including 4.05 g/t Au over 2.50 m in hole WB-19-26.
Stars (ddh): 0.13% Cu / 3.30 m, 0.154 g/t Au, 0.16% Cu over 1.25 m.

New showing: Canyon-1, Canyon-2, Canyon-3

2020 – 2021 Three (3) holes on **Ants** showing were selected for more assays. The goal was to characterize the gold zone of holes WB-19-026, 027 and 032. In association with the National Institute for Scientific Research (INRS) and the Geological Survey of Canada (GSC), a geological study was conducted in 2021 to perfect knowledge in the Labrador Trough on the main controls for known gold mineralization. Observations were made on Koksoak Block: Dessureault, Lafrance, Polar Bear, Alias, Golden Tooth, Wayne Block, Star Block, Ants Block, Didgeridoo-NAK Block: Didgeridoo and Canyon showings. GM 70234, GM 74154, Hébert (2022)

2024 – 2025 **Midland acquired the Kan Property from Tectonic**. A prospecting program was carried out on different blocks and showings: NAK area, Didgeridoo block, Jemina showing and Ants North. In 2024, a total of 114 rock samples and 78 soil samples were collected and assayed in the Canyon area. A total of seven (7) rock samples with Au over 1.0 g/t Au and a total of 16 soil samples considered as anomalous. In 2025, a total of eighty-five (85) rock samples (grab, channel) were sent to the laboratory. GM 74383, GM 74946

Results:

Canyon: Bests gold: 39.5 g/t Au, 1.32 g/t Ag and 62.7 Cu ppm (sample C1457706), 26.5 g/t Au, 0.61 g/t Ag, 183 ppm Cu (C1457502) and a total of seven (7 samples with Au over 1.0 g/t Au.
NAK: a rusty tension-type quartz vein cross-cutting sediments with 3% pyrrhotite-galena-sphalerite in clusters and veinlets returned 3.66 g/t Au. Altered gabbro returned 7.55 g/t Au.
Didgeridoo: Two (2) samples took in quartzite with pyrrhotite from this area returned respectively 9,180 ppm Zn, 2,330 ppm As and 1,100 ppm Zn, 433 ppm As.
Jemina: The best result is 0.55 g/t Au in a grab sample (Osisko's 2017 grab sample: 6.8 g/t Au)
Ants North: Prospecting around the historic sample did not replicate the gold value of 0.3 g/t Au of 2017
Oops: Two (2) samples returned 0.1 g/t Au (Osisko's sample returned 2.14 g/t Au in 2017).

Historical and recent diamond drill holes, rocks samples and bests assays map are available in **Appendix IV**.

Additional drilling is recommended to test for possible lateral and depth extensions of the mineralized zone.
1989	EXPLORATIONS NORANDA LTEE	GM 49486, GM 49487	18	1199	Lac Rougemont (Dessureault), Pyrite Falls	9 DDH on Rougemont showing (853 m), 9 short DDH on Pyrite Falls showing (346 m).	The first 100m vertical of Lac Rougemont was tested by DDH for gold potential. Gold is distributed erratically within the iron formation, connected to a branching network of veins and fine veinlets of quartz. At Pyrite Falls, 2 DDH intersected a small, gold-rich horizon near the surface, associated with quartz-carbonate-pyrrhotite and chlorite veins and veinlets crossing the iron formation. This formation is amphibolitized and extensively recrystallized as pyrrhotite and magnetite.

7 GEOLOGICAL SETTING AND MINERALIZATION (ITEM 7)

7.1 Geological setting

From Richard (2025), the Willbob Project is located within the Southeastern part of the Churchill Province (SECP). The SECP is part of the Trans-Hudson Orogen, a vast Paleoproterozoic orogenic belt that stretches from North Dakota to Greenland. This large orogenic system formed the North American Precambrian continent (Laurentia) by tectonic and magmatic accretion between ca. 2.0 and 1.8 Ga. The result is a collage of large and stable Archean cratons and micro-continents, as well as juvenile Proterozoic crust, magmatic arcs, and intracratonic sedimentary basins (Corrigan et al. 2018) (**Figure 13**). The SECP is a small part of this continent, lying between the Archean Superior Province to the west and the North Atlantic Craton to the east. The formation of the SECP is the result of two collision episodes (Charette et al., 2016); the Torngat Orogen (TO) (1.87-1.86 Ga), the collision of the North-Atlantic craton with the Core Zone, and the New Quebec Orogen (NQO) (1.83-1.80 Ga), the superposition of the amalgamed Core Zone and Torngat on the Superior Craton by an oblique collision (Corrigan et al. 2018). These collisions are supported by a dominant NNW-SSE structural grain characterized by many plurimetric to plurikilometric shear zones. Those shear zones define major sutures of the collage and thus, delimit the main geological zones of the SECP: The New Quebec Orogen (Labrador Trough), the Core Zone, and the Torngat Orogen (**Figure 14**).

7.1.1 Labrador Trough setting

The Willbob Project is located within the Labrador Trough, in the New Quebec Orogen, part of the Churchill Province, more specifically, the SECP (Figure 13 and 14). The Labrador Trough is the foreland (western part) of the New Quebec Orogen, which is divided into two major lithotectonic domains, the Labrador Trough in the west and the Rachel-Laporte Zone in the east (Figure 13). Rocks of the Labrador Trough extend approximately 850 km from the Grenville Front in the south to the western shore of Ungava Bay in the north. The Trough is limited to the west and north by the Superior Province, to the south by the Grenville Front and to the east by the Rachel-Laporte Zone (Figure 13) (MRNF-Lexique stratigraphique[4]).

The Labrador Trough is a southwest-verging Paleoproterozoic volcano-sedimentary belt that formed between 2.17 and 1.87 billion years ago (Rohon et al., 1993; Machado et al., 1988) along the northeastern margin of the

Superior Province. During the New Quebec Orogeny, the belt was folded, metamorphosed (greenschist to amphibolite facies), and thrust southwestward over the Superior craton (Hocq *et al.*, 1994; Hoffman, 1990).

The Trough contains a diverse range of sedimentary and volcanic rocks deposited in environments including continental rifts, passive continental margins, ocean basins, and river environments (Hocq *et al.*, 1994). It is especially well known for its banded iron formations in the Schefferville area, as well as several horizons of basaltic lava, numerous mafic and ultramafic sills of tholeitic affinity, and as mafic to felsic units of alkaline affinity, and the Le Moyne Carbonatite Complex hosted in a sequence of rhyodacite flows, highly potassic volcanics and basalts associated with dolomitic and pelitic sedimentary rocks (MRNF-Lexique stratigraphique[5]).

In details, its geological evolution is divided into three major depositional cycles (Clark et Wares, 2004):

First cycle (ca. 2.2–2.1 Ga): Consist of an intracratonic basin (rift) sequence overlain by a passive continental margin sequence beginning with the sandstone and conglomerate of the Seward Group lying on the Archean basement (Superior Province) and interpreted as an immature continental rift phase. About 2.2 Ga ago (e.g. Hoffman, 1988; Wardle *et al.*, 2002) the first-cycle sequence would have been deposited along the northeastern margin of the Superior Province. Following the cessation of rifting, the basin evolved into a passive platform margin, resulting in the deposition of sandstone and dolomite of the Pistolet Group. The accumulation of the Swampy Bay Group basalt and flysch sequence was deposited in a marine environment after the collapsing of the platform. The last sequence is represented by the deposition of the Attikamagen Group dolomitic reef complex during subsequent marine regression.

Second cycle (1.88–1.87 Ga): The Labrador Trough units belong to the Ferriman Group of the second volcano-sedimentary cycle and form a normal sequence unconformably overlying rocks of the Superior Province. The pile consists, from base to top, of arenites (Wishart Formation), iron formations (Sokoman Formation), turbidites (Menihek Formation) and basalts (Hellancourt Formation). The sequence is intruded by mafic and ultramafic sills (Gerido Intrusive Suite) and the mafic Baie Kyak Intrusion. The Core Zone is in tectonic contact with the Labrador Trough and is interpreted as Archean terrains reworked in the Paleoproterozoic (Bilodeau et Caron-Côté, 2018).

Third cycle: Consists of the Kaniapiskau Supergroup (Frarey and Duffell, 1964). Its composed of syn or post orogenic molasse (foredeep sediments) (Clark et Wares, 2004).

The Labrador Trough is divide into ten (10) lithotectonic zones classified into three (3) groups based on distinctive criteria such as lithological assemblages, structural style and mineral deposit distribution (Clark and Wares, 2004; Bilodeau et Caron-Côté, 2018) (Figure 15):

1. Autochtonous and parautochtonous sedimentary rocks:
   Berard and Cambrien

2. Allochtonous sedimentary rocks:

7.1.2 Labrador Trough Regional Geology

The source of this section is from the MRNF Sigéom Web Site: https://gq.mines.gouv.qc.ca/lexique-stratigraphique/

The Labrador Trough, as mentioned in chapter 7.1.1, is divided into ten lithotectonic zones. The zones observed in the regional area of the Willbob Project are describes as follows (**Figure 16**):

1. Montagnais Intrusive Supersuit

The Montagnais Supersuite consists of tholeiitic mafic to ultramafic intrusive rocks (Clark and Wares, 2004). It comprises two intrusive suites: the Wakuach Suite, which includes mafic sills intruded into rocks of the first volcano-sedimentary cycle of the Labrador Trough, and the Gerido Intrusive Suite, which comprises mafic to ultramafic sills intruded into rocks of the second volcano-sedimentary cycle (Bilodeau and Caron-Côté, 2018).

The Montagnais Supersuite extends along nearly the entire length of the Labrador Trough, covering more than 850 km in a general northwest–southeast (NW–SE) orientation, from the Lake Chaunet area (NTS sheet 25D08) in the north to the Grenville Front in the south. Its outcrop area occupies extensive portions of the central and eastern Labrador Trough. The cumulative thickness of the Montagnais Supersuite sills is estimated at approximately 6,000 m (Baragar, 1967).

- ⇨ Gerido Intrusive Suit

The Gerido Intrusive Suite was introduced by Bilodeau and Caron-Côté (2018) to group all sills intruding into rocks of the Labrador Trough's second volcano-sedimentary cycle (Koksoak, Le Moyne and Doublet groups). The Gerido Intrusive Suite replaces part of the Montagnais Sills unit. The other part, consisting of mafic sills intruding into the Labrador Trough's first volcano-sedimentary cycle rocks (Seward, Pistolet, Swampy Bay and Attikamagen groups), was assigned to the Wakuach Intrusive Suite. The Gerido Intrusive Suite is a lithodemic unit containing almost all of the mafic and ultramafic intrusions into the supracrustal units of the second volcano-sedimentary cycle of the Labrador Trough. This unit does not take into account the age or origin of intrusive rocks (Gerido Intrusive Suite. Quebec Stratigraphic Lexicon).

The **Kaniapiscau Supergroup** comprises three tectonostratigraphic cycles (Dimroth et al., 1970; Wardle and Bailey, 1981; Clark, 1988; Clark and Thorpe, 1990; Clark, 1994). In the Willbob Project area, only two of its geological groups are represented and described below.

2. Koksoak Group

The Koksoak Group is an allochthonous volcano-sedimentary unit belonging to the second tectonostratigraphic cycle of the Labrador Trough. It comprises the turbiditic and iron-rich strata of the Baby Formation at its base, directly overlain by the basaltic volcanic rocks of the Hellancourt Formation. The Koksoak Group is interpreted to have been deposited in a basin located east of the Ferriman Group platform succession (Clark and Wares, 2004). Facies variations within the lower sedimentary units of the Koksoak Group indicate deposition in a basin that progressively deepened eastward (Clark, 1988; Goutier and Wares, 1991; Wares et al., 1988; Wares and Goutier, 1990a).

- ⇨ Hellencourt Formation

  Massive or pillowed basalt, with minor mafic pyroclastic rocks, mudrock, and amphibolite.

⇨ Baby Formation

The Baby Formation is an allochthonous volcano-sedimentary unit that constitutes the lower part of the Koksoak Group (Clark and Wares, 2004). The fromation is divided into three (3) members (Upper Baby, Middle Baby and Lower Baby members) and comprises six informal lithostratigraphic units:

- Mudstone, phyllite, slate, and siltstone unit, locally micaceous or carbonate-bearing;
- Dolostone, diopside marble, calcareous schist, and calc-silicate rock unit;
- Wacke unit containing interbedded conglomerate (turbidite) layers;
- Quartzose sandstone, sandstone, and quartzite unit;
- Basalt unit composed of massive and pillowed flows, with amphibolite;
- Pelitic schist unit containing quartz, biotite, muscovite, and locally garnet, together with slate, black mudstone, and phyllite.

Metamorphic grade within the Koksoak Group increases from greenschist facies in the west to amphibolite facies in the east and at the northern end of the Labrador Trough (Dimroth and Dressler, 1978; Fraser et al., 1978).

3. Attikamagen Group

The Attikamagen Group is an allochthonous unit of sedimentary rocks in the upper part of the first volcano-sedimentary cycle of the Labrador Trough (Clark and Wares, 2004). It consists mainly of dolomite belonging to the Denault Formation, which is present along most of the length of the Trough. It comprises three (3) formations: Dolly, Fleming and Denault. Only the Denault Formation is relevant to the project.

⇨ Denault Formation (formerly Abner Formation)

The Denault Formation is an allochthonous volcano-sedimentary unit forming the base of the Attikamagen Group.

Predominantly composed of dolomite, sandy dolomite, dolomitic sandstone, breccia and intraformational conglomerate, stromatolitic dolomite, interstrtified siltstone, shale and fine-grained sandstone. This formation is divided into 13 subdivisions. For subdivision details, refer to the MRNF - Stratigraphic Lexicon[6]

The economic potential of the Denault Formation lies in epigenetic lead-zinc mineralization hosted in stromatolitic dolomites (Clark and Wares, 2004).

7.1.3 Structural geology

From Bilodeau et Caron-Côté (2018), the entire Churchill Province (Labrador Trought and Core Zone) was affected by the New Quebec Orogenesis. The direction of tectonic constraints has evolved over time, changing the tectonic style (Madore et Larbi, 2000).

This event is associated with at least two distinct deformation phases:

1. A shortening phase related to the generation of thrust faults and regional folds;
2. A transpressional tectonic episode that causes rocks of the Bonnard Domain to overthrust those of the Payne Domain, via the Virgin Deformation Corridor, accompanied by dextral strike-slip along this latter structure.

From Clark et Wares (2004), most of the structures within the fold belt are attributed to oblique dextral collision between the Archean internal zone of the orogen to the east and the Superior Province to the west (Hoffman, 1989, 1990b; Wardle et al., 1990b, 2002). The regional structural fabric of the fold belt trends NNW–SSE, and folds generally plunge toward the SSE at an average angle of approximately 15°. Collision-related structures include the major mapped folds and several generations of thrust faults, some of which, such as the Rachel Lake and Olmstead Lake faults, also exhibit a dextral strike-slip component (Goulet, 1987; Goulet, 1995). The Tudor Lake Fault, located in the orogenic hinterland, is a major dextral transpressional structure with both strike-slip and thrust components. Near Ungava Bay, the Turcotte Lake Fault may represent its northern equivalent (Wardle et al., 2002).

Recent field investigations indicate that the basal detachment underlying the Proterozoic succession north of Payne Bay accommodated an early phase of southeast-directed displacement (Madore and Larbi, 2000). These early structures were subsequently reactivated during a later phase of southwest-directed deformation (Madore and Larbi, 2000; Goulet, 2001).

At least four phases of deformation are recognized in the northern Labrador Trough (Wares and Gouthier, 1990) (Table 4). The two earliest phases of deformation are best recorded in the Rachel Zone where they correspond to the development of a basal décollement (D1) and NW transport of basement-cored Pennine-style nappes (D2) (Richard, 2024). The third deformational event (D3) encompasses the main stage of compression and is characterized by a SW to WSW transport direction. In the Baby zone, this event is preserved as two increments of deformation: the D3 (early) and D3' (late) stages. D3 in the foreland is characterized by penetrative schistosity, isoclinal folds and sheath folds. D3 folds trend NW to NNW and are overturned to the SW. D3 thrust faults are mostly bedding parallel in the Gerido and Thévenet domains, as indicated by a paucity of stratigraphic repetition within younger (D3') thrust slices. The main tectonic fabric of the orogen is the result of D3'. This event is recorded in all four zones. In the Baby and Rachel zones, it produced NW- to NNW trending, open to tight, large-scale, upright to overturned folds with axial planer crenulation cleavages. D3 faults, such as the bedding-parallel thrusts at the base of the Hellancourt Formation, are folded by D3' structures. D3' high-angle reverse faults are abundant, truncate D3' folds, and are limited to the Gerido and Thévenet Domains. The Robelin and Archiac faults are D3' structures that separate the Mélèzes and Gerido and Gerido and Thévenet Domains, respectively. D4 is observed in the Chioak and Baby zones; it resulted in NE-trending upright open folds that created local dome and basin patterns with D3' folds (Wares and Gouthier, 1990; Richard, 2014).

TABLE 4. Resume of the four major structural events affected the Labrador Through.

Event	Description
D1	• Predominantly found in sedimentary units • NNE-trending penetrative schistosity, isoclinal folds dipping toward the NW, and sheath folds • Detachment zone (Base of the Hellancourt Formation) • The Robelin, Archaic, Hérodier, and Garigue Faults
D2	• Mostly found in the Rachel and Kuujjuaq areas (not identified in the study area) • Formation of straight, open folds-oriented E–NE
D3	• Coaxial to D1 • Folds oriented NW-NNW, straight or dipping toward the SW
D4	• Straight folds and normal faults to the northeast • Axial cleavage • Interference pattern (Type 1-3, Ramsay 1967), with D3

7.2 Property Geology

The Willbob Project is located within the Labrador Trough, in the Gerido geotectonic Zone.

7.2.1 General description

The description of the geology of the project is divided into 6 blocks and described from north to south:

7.2.1.1 Koksoak Block and Wayne Block

Almost the entire project area (**Figure 17**) is underlain by rocks of the Montagnais Supersuite, predominantly those of the Gerido 2 Intrusive Suite and with minor amounts of Upper Baby 1 Member. The northern portion of the Project is characterized by an antiform–anticlinal fold (SIGÉOM). The fold comprises an alternating sequence of sedimentary rocks of the Upper Baby 1 Member, iron formation and metachert of the Middle Baby Member, and gabbro of the Gerido Intrusive Suite. The middle, near the Dupuy Lake, is represented by intense folding of Baby Formation sediments and Montagnais sills and the absence of the Hellancourt volcanics rocks (Richard, 2025). The folds are mainly composed by the quartziferous gabbro and quartziferous diorite of the Gerido 4 Intrusive Suite, the gabbro of the Gerido 2 Intrusive Suite and the sedimentary rocks of the Upper Baby 1 Member. Toward the southern part of the Project, pillowed basalt (Hellancourt 1 Formation) and massive basalt (Hellancourt 2 Formation) become progressively more abundant. Mudstone, siltstone, and graphitic black slate units are also observed (Upper Baby 1 and Baby 7 Members). Many high grade showings of Wayne (32.7 g/t Au) and Janet (140.5 g/t Au) are associated with these units (Richard, 2025). The Wayne Block consists essentially of the same units. The eastern boundary of the Wayne Block is defined by the dextral-reverse Hérodier Fault. To the west, the reverse Bowen Fault trends northwest–southeast, transects the Project area, and continues along the eastern boundary of the Koksoak Project (**Figure 17**).

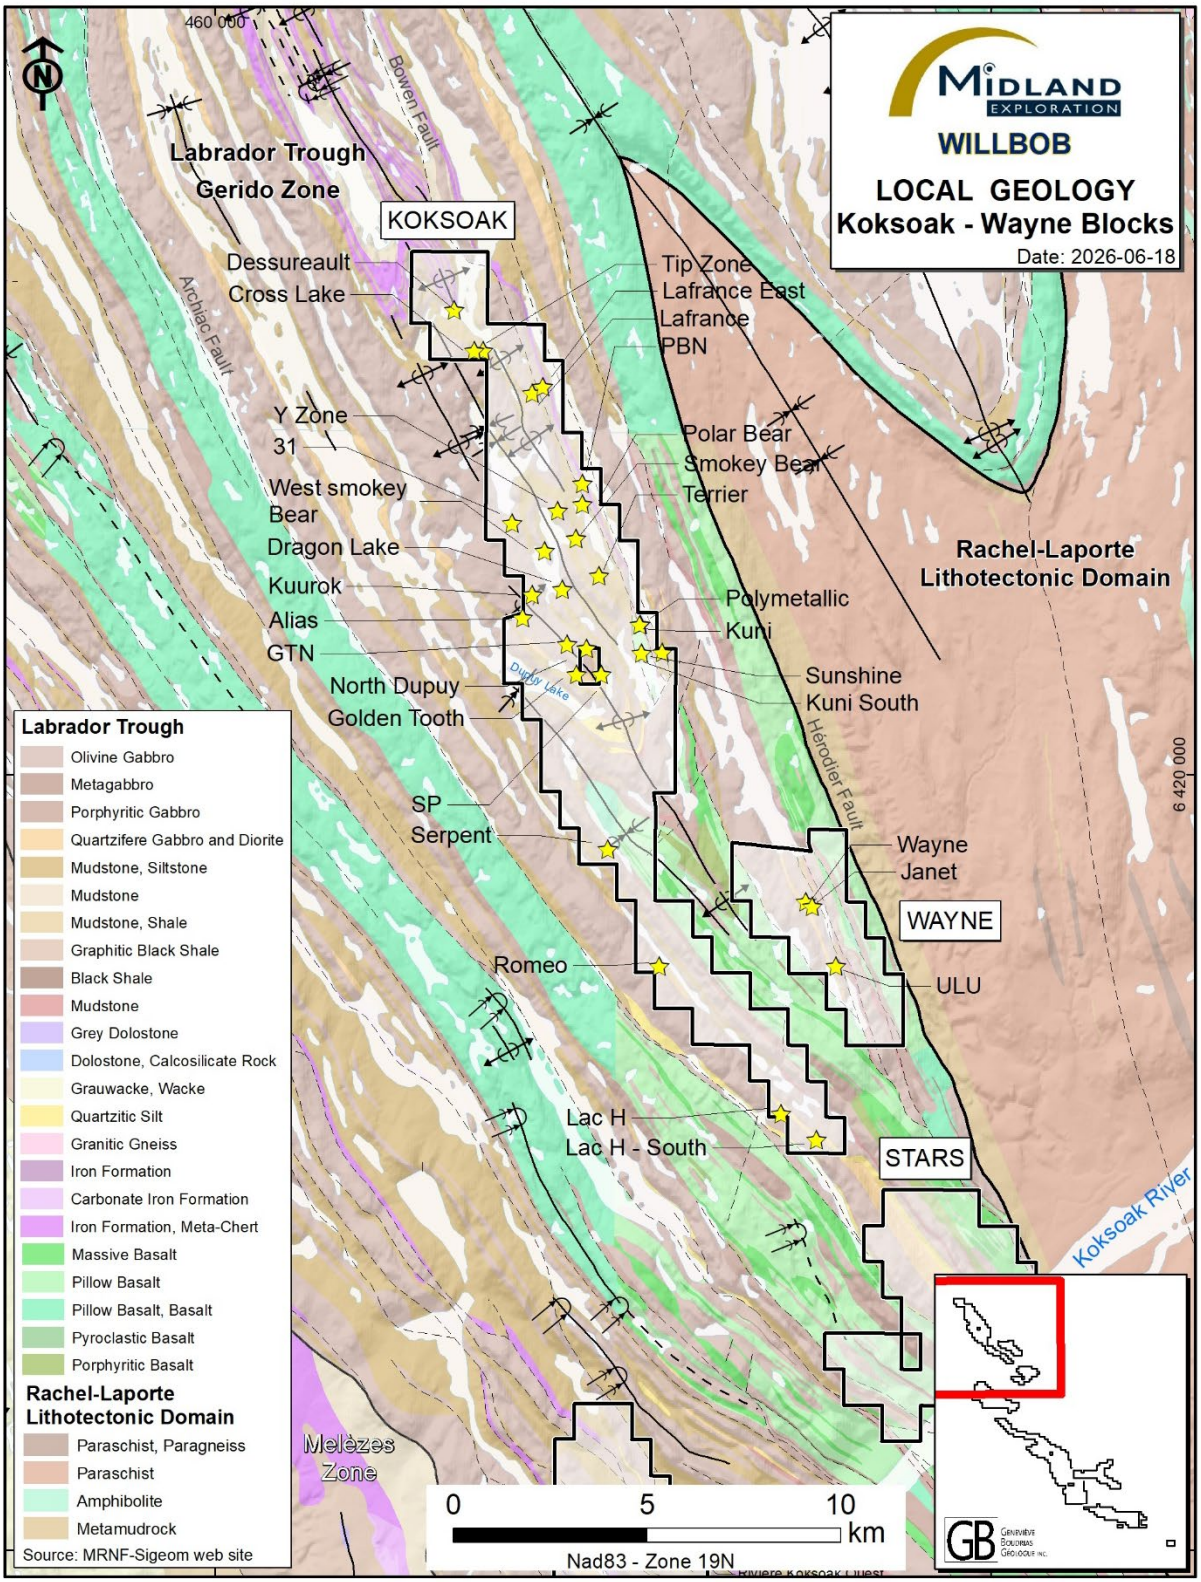

Figure 17. Koksoak and Wayne Blocks geology

7.2.1.2 Stars Block

The Stars Block consists of essentially the same lithological units as the Koksoak and Wayne areas. The stratigraphic sequence is characterized by alternating units of pillowed basalt, massive basalt, gabbro, and graphitic black mudstone/shale (Figure 18). The overall sequence is less deformed and folded than the Koksoak sequence. The eastern limit of the Block is defined by the Hérodier Fault, whereas the Archiac Fault cuts across the project area in a northwest–southeast direction.

7.2.1.3 Ants Block

This area is characterized by an alternation of gabbro and iron formation units. Many mapped diorite/quartz gabbro are yet to be confirmed as many of these are not outcropping, covered with superficial deposits (Richard, 2025). Ants Block is characterized by several faults trending NW-SE and is comprised to the west by the Robelin Fault and to the east by the Rasle Fault (Figure 18). At Ants, gold is associated with the altered diorite unit which dip with a low angle. This unit have been followed by DDH over 100's of metres and is open in many directions at depth (Richard, 2025).

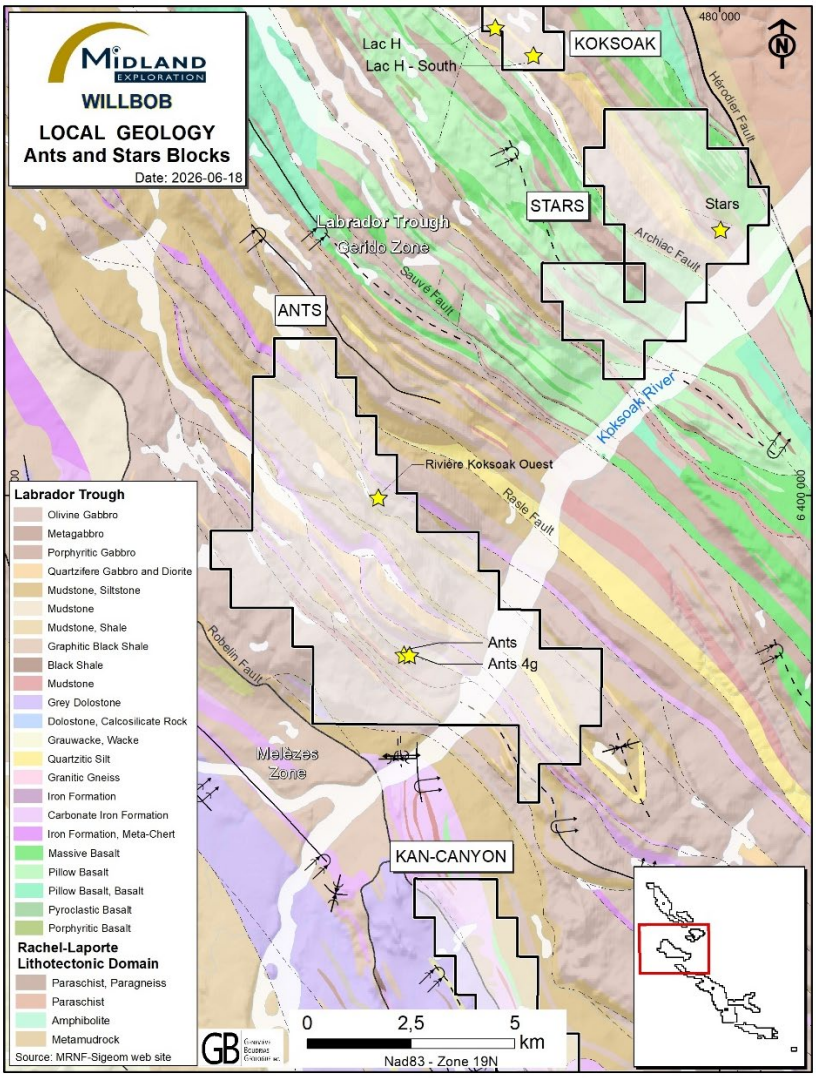

Figure 18. Stars Block geology

7.2.1.4 KAN-Canyon Block

The Canyon Block is characterized by the presence of numerous sedimentary rocks belonging to the Baby Formation (Richard, 2025). From the west, the lithologies are dolomite (Denault 2 Formation), iron formation, phyllades, sulfur-bearing graphitic phyllades, turbidites, basalts (Middle Baby 1 Formation), carbonated gabbro (Gerido 2 intrusive Suite), mudstone and siltstone (Superior Baby 1 Member) and some units of quartziferous silt and conglomerate (Superior Baby 2 Member). A small unit of basalt is present, just east of the Colt showing (Figure 19). The Baby middle Member is overlain by a sequence of turbidites, quartzitic sandstones and phyllites that correspond to the Baby upper Member. Structurally, the sector is characterized by the Canyon synform and a complex network of faults. Gabbroic Montagnais sills are common in this part of the project, but no diorite has been reported until now. Lithological units in this area have NNW-SSE trend and most of them are separated by inverse faults. Lateral facies variation makes it difficult to correlate the different observed iron formations across the property. However, in general, the oxidized facies are observed in the eastern part whereas the carbonate and silicate facies are more common in the median and western part of the Trough. The sulphide rich iron formation is found sporadically in the western part of the Trough and lies on top of the sequence. It is difficult to estimate the exact thickness of the middle members of the Baby Formation mainly due to the presence of thrust faults, folding and by the presence of numerous gabbro sills. The most obvious polarity indicator was observed as a normal sorting in polygenic conglomerate of the median Baby Formation indicating a polarity younging oriented towards 110°N. Other indicators of normal sorting were observed in the carbonate iron formation near the Ferricrete showing (Tremblay & Lee, 2018). Figure 20 shows the evolution of stratigraphy from West to East.

7.2.1.5 Didgeridoo-NAK Block

The Block is bordered to the west by the Robelin Fault and characterized by a lot of Montagnais sills and the presence of quartzites and conglomerates (**Figure 21**). These polymictic conglomerates are deformed and metamorphosed. They contain fragments of dolomite and iron formation crosscut by tension quartz veins. The conglomerate itself is crosscut by quartz veining, meaning it is synorogenic in nature. There is also a large syncline fold that characterizes the area and a complex system of faults and folds (Tremblay et Lee, 2018).

7.2.1.6 Opps Block

From Richard (2025), the Oops Block is comprised in the sedimentary Baby Formation. An iron formation outcrop returns gold in quartz veins. The first derivate of the magnetic survey shows a strong signature that could represent an open folded iron formation (**Figure 22**). The gold showing found by Osisko yielded 2.14 g/t Au and seems to be at the hinge of the fold. The first fieldwork by Midland in this area was in 2025.

7.2.2 Structure

On the Kan-Canyon Block, from Tremblay et Lee, 2018, the deformation regime observed at the project scale can be related to two major compression events. The first one is related to a dextral transpressive convergence-oriented NE-SW and is referred to as "*D1*". This transpressive convergence regime is mentioned by many other authors during the last decades (Hoffman, 1990; Wardle at al., 1990; Corrigan et al., 2009) and explains the major fabric orientation in the Trough. Applied to a smaller scale, this deformation event explains the NNW-SSE overturned isoclinal folding in the Ferricrete Area as well as the overturned folding observed in the Pump Pad Ridge Area. In particular, the Pump Pad Ridge folding is characterized by an axial plan oriented N270°/15° with a fold axis plunging to ESE. The axial plane appears to be deformed; it turns slightly to the south when moving eastward and turns to the north when moving westwards. This geometry can be explained by a transpressive convergence regime, which would have created a sigmoidal fold axis pattern with dextral movement along the thrust fault, as explained in the Woodcock and Schubert (1994) model. The geometry of the Pump Pad Ridge area must be catalyzed by the anisotropy between the big body of gabbro to the north and dipping under the E-W folding. The second deformation event is related to an E-W compression, referred to as "*D2*". This late event created open, penetrative folding oriented N350/80° with a fold axis that varies depending on the position relative to D1.

7.3 Mineralization

The Labrador Trough contains deposits typical of a Paleoproterozoic volcano-sedimentary belt developed on the margin of an eroded Archean continent following crustal rifting. In addition, several epigenetic deposits are related to the movement of hydrothermal fluids during tectonometamorphic events associated with the formation of orogeny. The type of deposits found in orogeny are similar to types of economic deposits observed worldwide in rocks of similar age (Meyer, 1988, Tremblay et Lee, 2018).

From Richard (2024), many showings were found on the actual Willbob Project. Around 40 gold showings were found on the Willbob Project and over 30 of them were found by Midland since 2014. Most of the gold showings discovered by Midland are associated with quartz veins in alteration zones, mostly ankerite-chlorite-albite, injected in diorite or gabbro. In that type of mineralization, a close association with pyrrhotite or arsenopyrite is observed on many gold showings. It appears that pyrrhotite is most likely to be associated with high gold values. Other gold showings found by Osisko between 2013 and 2017 are now part of the Willbob Project (BOMT, Canyon, Oops, among others). These showings are quartz veins injected into carbonated iron formation. Finally, gold can be found in volcanogenic massive sulfide as is the case with the Stars Showing.

Table 5 summarizes the different gold showings found over the year on the actual Willbob Project and map of the showings details is provided in Appendix IV.

8 DEPOSIT TYPES (ITEM 8)

This section is adapted, in part, from Richard's report (2024, 2025), in which this topic is discussed in detail.

The Labrador Trough is known for many types of deposits: Superior type Iron, VMS (Zn-Cu-Pb-Au-Ag), black shale (Au-Zn) and glomerophyritic gabbro (Ni-Cu-EGP-Au). However, it is less known for gold occurrences. Nonetheless, Midland Exploration recognizes a very favorable regional setting for orogenic gold deposits (Richard, 2024, 2025):

- Favorable iron-rich lithologies to precipitate gold – abundant iron-rich gabbro (ex. Ants), diorites, iron formations (ex.: Pump Pad Ridge), black shales
- Greenschist facies rocks
- Polyphase deformation, abundant thrusting and folding
- Major crustal-scale structure separating older, lower grade volcano-sedimentary metamorphic rocks, from younger, higher grade (amphibolite) metasedimentary rocks
- Syn-orogenic, polygenic conglomerates – possibly marking major reactivated normal faults within the orogeny.

From Trépanier et al., 2026, in the Labrador Trough, the two main host lithologies of orogenic minerals are (**Figure 23**):

1. Quartz veins in silicate-carbonate iron formations
    - **Au-only**
    - Au-As

2. Quartz veins and replacements in the upper parts of syn-volcanic, differentiated gabbro layer veins (diorite, quartz diorite, tonalite)
    - Various metal assemblies and structural styles

- Au-only (south-half, +important)
- Au-As (north)
- Au-Ag-Cu
- Au-Ag-Pb-Zn

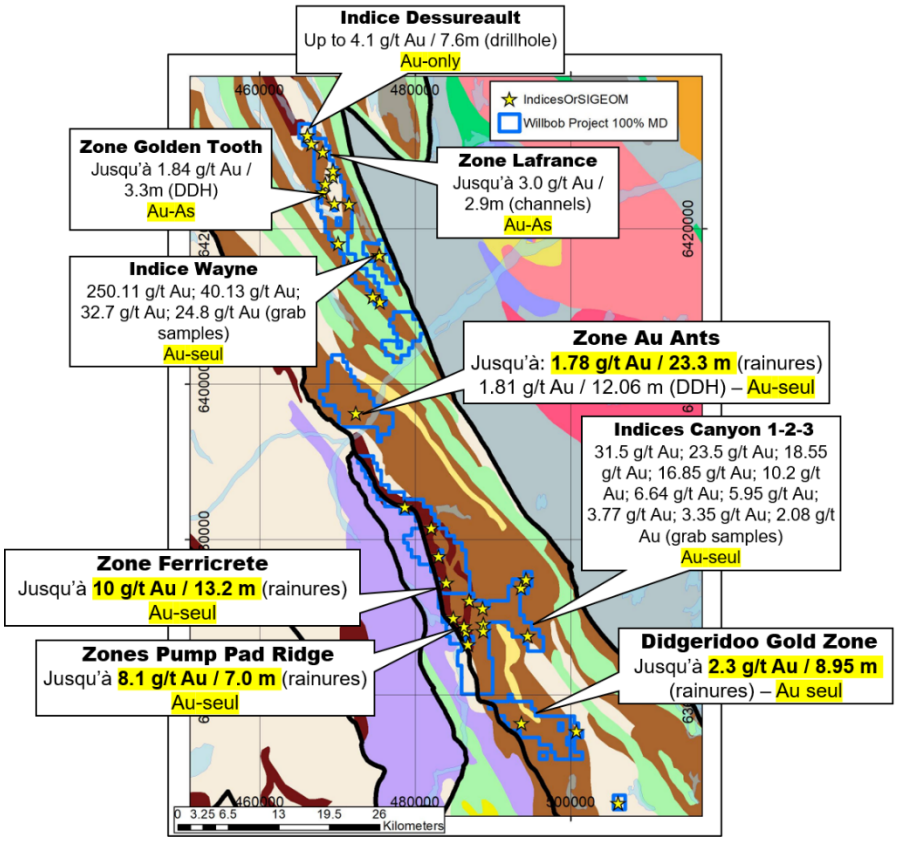

Figure 23. Orogenic Gold context (Trépanier et al. 2026)

8.1 Orogenic Gold Deposits

Orogenic gold deposits are formed by fluids that rapidly go through a large crustal thickness at the ductile-brittle transition in a compressive tectonic regime. This strong flow of fluids destabilizes the gold hydrosulfide complex ($Au(HS)_2$) and, combined with one or more other factors such as temperature-pressure decrease, fluid-rock chemical interaction, boiling fluid, a mixture of fluid and chemical sorption, provokes gold precipitation (Bölkhe, 1982).

These deposits are distributed along large areas of crustal scale faults (Figure 24) formed in a regime ranging from compression to transtension, within deformed greenstone terrains. These lands usually coincide with important lithological boundaries in a convergent margin, such as those separating sedimentary domains from volcano-plutonic domains. These deposits are epigenetic mineralization with structural control characterized by simple networks of quartz-carbonates veins produced by the filling of faults which are gold carriers. These veins are hosted in moderately to strongly compressive, brittle-ductile faults and shear zones, with hydrothermal breccias and extensional veins locally associated with them. The deposits are formed at intermediate depths (from 5 to 10 km). The emplacement of mineralization is contemporaneous with the intermediate and late phases of the deformation and took place after the attainment of the maximum conditions of greenschist facies metamorphism or amphibolite facies. Mineralization is generally associated with iron carbonates alterations.

Gold is largely trapped (free gold) in a network of quartz-carbonate veins but is also present in significant amounts in iron-rich sulphide bearing wall clasts or in silicified arsenopyrite-rich replacement zones (±pyrite, ±pyrrhotite, ±chalcopyrite).

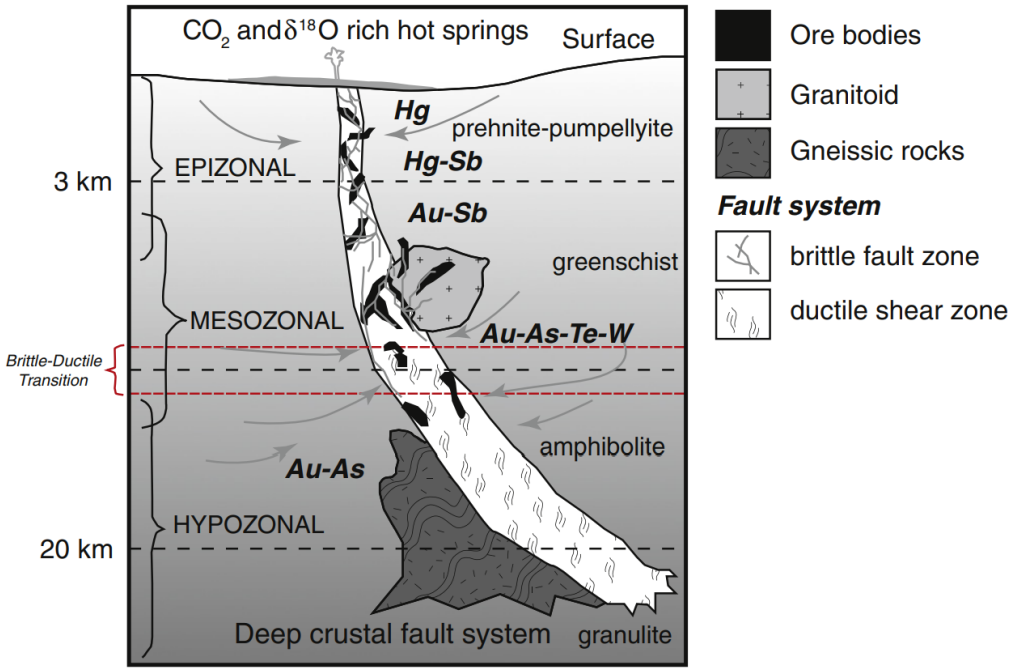

Figure 24. Orogenic gold deposits can form over a variety of depths, from as shallow as 3 km to as deep as 20 km, typically during late orogenic shifts from compressional to transpressional or transtensional regimes. Most of the deposits form in the greenschist facies or at the greenschist–amphibolite boundaries from aqueous-carbonic, high δ18O fluids that have moved upward along trans-crustal fault zones. Modified after Groves et al. (1998), in Godfarb et Groves, 2015[7,8].

8.1.1 Gold in Silicate-carbonate iron formation

Trépanier et al., (2026) mentioned that in the area, numerous gold occurrences hosted in a silicate-carbonate iron formation at the contact with metalliferous black shales are observed (Figure 25). Pump Pad Ridge is an example of that kind of gold deposit. The geological context at Pump Pad Ridge can be compared to the world-class Homestake gold deposit, South Dakota (40 Moz Au). The common features are (Figure 26):

- 1.9 Ga silicate-carbonate iron formation, 30–50 m thick.
- Trans-Hudson orogeny, with metalliferous black shales and turbidites on either side.
- Similar structural style and timing of gold mineralization: early isoclinal folds are barren, whereas gold mineralization is associated with later folding. Gold is not associated with the most prominent folds shown on the map.

8.1.2 Gold in black shale

From Gaboury (2021), the sources of gold for orogenic deposits have been reviewed by numerous authors (e.g. Gadoury 2019, Godfarb et Groves, 2015, Frimmel, 2008). Gold can be sourced from intrusion degassing (Sillitoe et Thompson, 1998) and oceanic basalt devolatilization (e.g., Pitcairn et al., 2015, Augustin et Gaboury, 2017, Patten et al., 2020). However, carbonaceous- and pyrite-rich sedimentary rocks, commonly referred to as black shales, are considered one of the most important sources (e.g., Gaboury, 2019, Tomkins, 2013, Pitcairn et al., 2010, Large et al., 2011, Gaboury et al., 2020, Gaboury et al., 2021, Large et al., 2012, Pitcairn et al., 2021). The ultimate support for a sedimentary gold source model is provided by the link between gold dissolved in oceans and the temporal distribution of orogenic gold deposits (Figure 27).

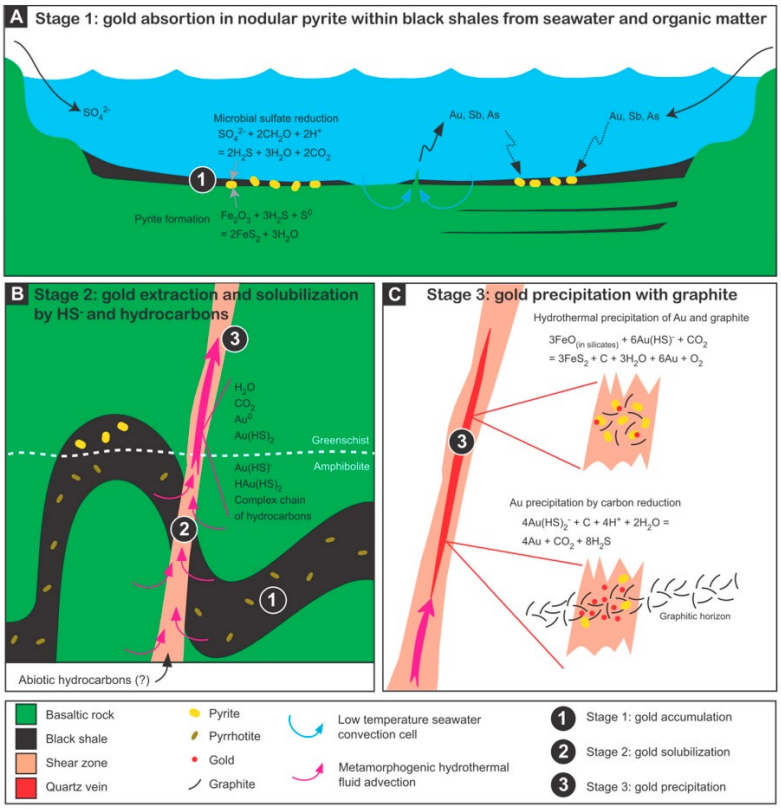

Figure 27. Schematic representation of the role of carbonaceous organic matter in the formation of orogenic gold deposits in three stages. (A) Source stage when gold in seawater accumulates in primary pyrites from the bacterial reduction of sulfate in organic material-rich sediments; modified from Rickard et al. (B) Mobilization stage when gold is solubilized by hydrocarbon-metal complexes and as colloidal gold nanoparticles for hydrothermal transport along faults following basin inversion and related tectonic shortening and metamorphism. Hydrocarbons are generated by thermal maturation of black shales or from abiotic deep contributions. (C) Precipitation stage when gold is co-precipitated with graphite from hydrocarbon-rich fluids or when gold is precipitated by carbon-rich reducing horizons. From Gaboury, 2021.

8.1.3 Gold hosted in differentiated gabbro sills.

Ants showing is an example. The mineralization is a pervasive replacement-style mineralization developed in the upper part of a differentiated gabbro sill, within the quartz diorite unit, at the contact with the overlying turbidites.

9 EXPLORATION WORKS (ITEM 9)

Since 2014, acquisition year, Midland undertook several prospecting surveys over Willbob Project and the different blocks (See Chapter 6.2.1). The last exploration works executed by Midland, was during summer 2024 and 2025 and was consisting in prospection and soil sampling over the NAK area, Didgeridoo block, Jemina showing and Ants North (GM 74383, GM 74946).

9.1 Prospecting

During 2024, the main objectives were to follow up on the Canyon high grade gold showing and to prospect the area southeast of the Golden tooth showing. A total of one hundred and fourteen (114) rock samples were collected and sent to the laboratory.

In 2025, five (5) areas were prospected: NAK area, Didgeridoo block, Jemima showing and Ants North. A total of 85 rock samples, and four (4) QAQC were sent to the laboratory. The best gold result of the prospecting campaign returned 7.55 g/t Au on an outcrop of iron formation with quartz-calcite veins. It is the only gold value of the showing type (> 1g/t Au), 3 kilometres south of the NAK showing. The Author visited five of these showings.

9.1.1 Canyon area - *visited*

A total of 109 rock samples were collected. Several high-grade gold values were obtained in the Canyon area. From the samples collected, 2 returned very high gold values (39.5 and 26.5 g/t Au), 4 returned high gold values (between 2.96 and 9.85 g/t Au) and 7 returned results over 0.2 g/t Au. It was determined that the samples with gold can be classified in 3 categories: Te±Bi±Ag, Au only and As-Cu-Ag (Richard, 2024). **Table 6** shows the best gold samples from 2024 Canyon survey.

9.1.2 Golden Tooth area - *visited*

Six (6) samples were taken 600 m southeast of the Golden Tooth showing. The target was the hinge of an anticlinal fold with the possibility to present unmapped diorite. Some quartz veins injected in quartz gabbro were encountered. Rust, ankerite and some sheared were also observed. The best results return 66 ppb Au.

9.1.3 NAK area

The main target was a Cu-W-Sb anomaly in the lake just to the southwest is present in an area never prospected. No significant result was obtained. West of the NAK showing (2.5 km), the target was a gold anomaly in a lake sediment where folding occurs. Several veins of rusty quartz-calcite were observed over a 5 m stretch. The thickest vein was 25-30 cm and was mineralized with 1% chalcopyrite. The vein continued for 8 m long, and it returned 18 ppb Au and 0.11% Cu (C2131312) (Richard, 2025). And another target was hinge of major fold in an area where significant veining was observed in the past and the presence of an Au-Sb bottom lake sediment anomaly located 2 km and 3 km south-southwest of the NAK showing. The highest gold value of the program was obtained in a white quartz vein within a sheared and altered gabbro returned 7.55 g/t Au.

9.1.4 Oops area

Prospecting from 2025 encountered several quartz veins, from 10 cm to 2 m thick, almost all of them were altered to ankerite and mineralized with trace pyrrhotite at 2%. Two (2) samples returned 0.1 g/t Au (C2131259, C2131357 (Richard, 2025).

9.1.5 Jemina area

The area is outcropping and shows several quartz-carbonate veinlets parallel to the schistosity, with traces of pyrrhotite. The veinlets zone is approximately 1.5 m thick. Three (3) anomalous gold results were obtained, all in iron formation with quartz-carbonate veins. The best result is 0.55 g/t Au (Richard, 2025).

9.1.6 Ants – Ants North area - *visited*

From Midland Press Release[9], discovered in 2018, the Ants mineralized zone is characterized by the presence of sulphides, mainly consisting of 1-15% pyrrhotite with traces (up to 1%) chalcopyrite. These sulphides are disseminated or clustered in a quartz diorite host rock that is strongly altered to iron carbonates and albite and locally injected with quartz-carbonate veinlets. Note that visible gold was observed in many locations.

Channel sampling results from 2018 (**Photo 5**) yielded the following intervals (see press release dated November 15, 2018): 1.78 g/t Au over 23.3 metres, including 3.19 g/t Au over 10.0 metres (channel ANTS-18-03); 3.33 g/t Au over 5.0 metres (channel ANTS-18-02); 2.22 g/t Au over 4.5 metres (channel ANTS-18-04).

Photo 5. Ants 2018 channel sampling (ANTS-18-03) (Field visit, June 2026).

Throughout the September 2019 drilling campaign on the Ants showing (see press release dated October 23, 2019), nine (9) drill holes totaling 910.5 metres were drilled (WB-19-25 to WB-19-33). Best results are as follows: 1.81 g/t Au over 12.06 metres, including 2.99 g/t Au over 4.56 metres (WB-19-33), and 2.09 g/t Au over 6.01 metres, including 4.05 g/t Au over 2.50 metres (WB-19-26).

During the 2025 field survey, follow-up work was conducted at Ants North (Target A) on a silicified quartz gabbro sample containing 3% quartz veins, 3% pyrrhotite, and traces of chalcopyrite. Prospecting around the historic sample location did not reproduce the 0.3 g/t Au value reported in 2017 (Richard, 2025).

9.1.7 Didgeridoo area - *visited*

The Didgeridoo Zone is located in the south part of the Kan Block, approximately 15 km southeast of the main gold showings found in the Kan area now held 100% by Midland (see press release dated April 22, 2025[10]).

[9] https://midlandexploration.com/en/2026/07/08/midland-begins-drilling-program-on-the-willbob-gold-project-in-the-labrador-trough/

[10] https://midlandexploration.com/en/2025/04/22/midland-announces-the-acquisition-of-the-kan-gold-project-in-the-labrador-trough/

The Didgeridoo Zone consists of a 5 to 10-metre-wide shear zone trending NW-SE that hosts abundant fault-filling quartz-calcite veins (**Photo 6**), occurring in gabbro and quartz diorites. Up to six (6) occurrences of visible gold were observed within this zone, which has been exposed by stripping over a strike length of approximately 100 metres and remains open at both ends.

Photo 6. Didgeridoo quartz-calcite vein (Field visit, June 2026).

Channel sampling conducted on the Didgeridoo Zone in 2018 returned several gold results including:

- Channel DJ-05: **2.30 g/t Au over 8.95 m** incl. **3.56 g/t Au over 3.15 m** *(open to the NW)*
- Channel DJ-02: **4.71 g/t Au over 2.90 m** incl. **9.30 g/t Au over 1.30 m**
- Channel DJ-01: **1.67 g/t Au over 8.80 m** *(extension of the 2017 channel)*
- Channel DJ-04: **1.45 g/t Au over 6.70 m**

(From Midland Press release 2025-07)

The zone thus remains open to the northwest.

The exploration 2024-2025 campaign conducted around where many samples were taken, the maximum gold result obtained was 9 ppb Au. Same for Zn and As which returned only anomalous As around 90 ppm (Richard, 2025).

A detailed cartography of the Didgeridoo showing was made (**Figure 28**). Didgeridoo is interpreted as a dextral shear zone with many fault fill veins, and the presence of undeformed *en echelon* extensional veins in conjugate shears (Richard, 2025).

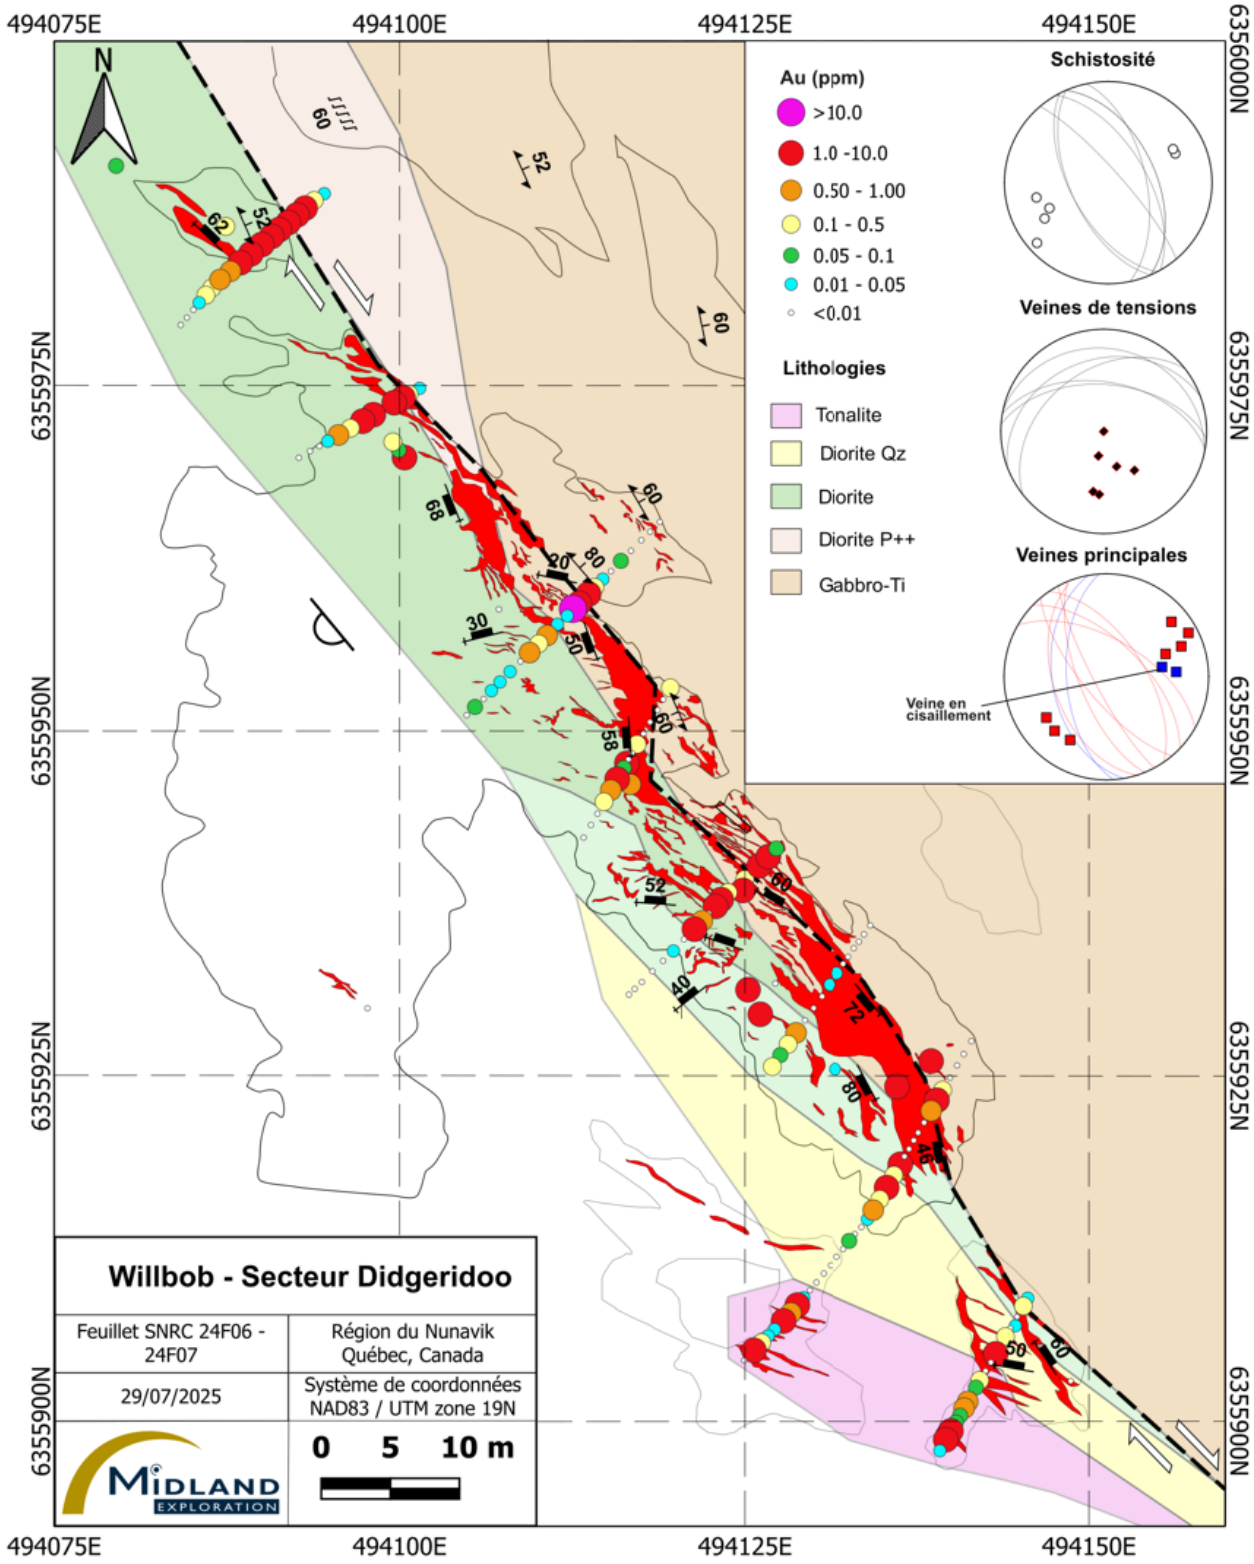

Figure 28. Didgeridoo stripping and channel sampling assays (Midland. Credits: Maxime Dour, geo).

9.2 Soil sampling

9.2.1 Canyon area

In 2024, a Horizon B soil survey was conducted in the Canyon area for a total of 78 soil samples. A trend of anomalies was detected by a survey just north of Canyon-3. Out of 5 close-together anomalies, three (3) are anomalous in gold. The maximum gold obtained was 431 ppb Au (Richard, 2024).

10 DRILLING (ITEM 10)

Midland, since the acquisition of the project, has executed three (3) diamond drilling programs. The first was in 2016, the second, in 2017, which consisted of a two-phases campaign and the last one was in 2019 (Table 7). Table 8 exposes the best results obtained during these drilling campaigns.

In 2025, Midland acquired a 100% interest in the Kan Project from Ressources Tectonic. The project was previously held by Osisko Mining from 2015 to 2019. For the purposes of this report, the details of the drilling surveys conducted by Osisko on the Kan Project are presented in Section 10.3, Table 9 and Table 10.

All the best assays intervals presented in this section have been recalculated and validated by the Author. The results of the validation are presented in Section 12.1.

10.1 2016-2017 drilling campaign

Twenty-two (22) surface diamond drill holes were executed. A total of 3,305 samples for metal and gold analysis and 129 whole rock samples were taken.

During the 2016 drilling campaign, on Koksoak Project, a total of 1,295 metres of NQ caliber were drilled in height (8) holes: Four (4) on Lafrance showing and four (4) on Golden Tooth showing (Figure 29).

During 2017, the aim of the two-phases diamond drill campaign was to test seven helicopter-borne soundings. In Phase 1, the holes were drilled on Golden Tooth (3), GTN-4 (1), Kuurock (1) and Polar Bear (2) showings for a total of 1,833.2 metres (Figure 29).

For Phase 2, seven (7) more holes were drilled over the Polar Bear (2), Sunshine (1), Kuni (1) and Stars (3) showings. A total of 1,701.3 metres were drilled in NQ size (Figure 29, Figure 30).

Hole dips and bearings were measured with a “Flexit” down hole magnetic survey instrument. The NQ size core was logged for geology (among others lithology, alteration, mineralization and structural data), core recovery and RQD were measured except for the 2017 holes. Recoveries were excellent, being predominantly at or near, 100%.

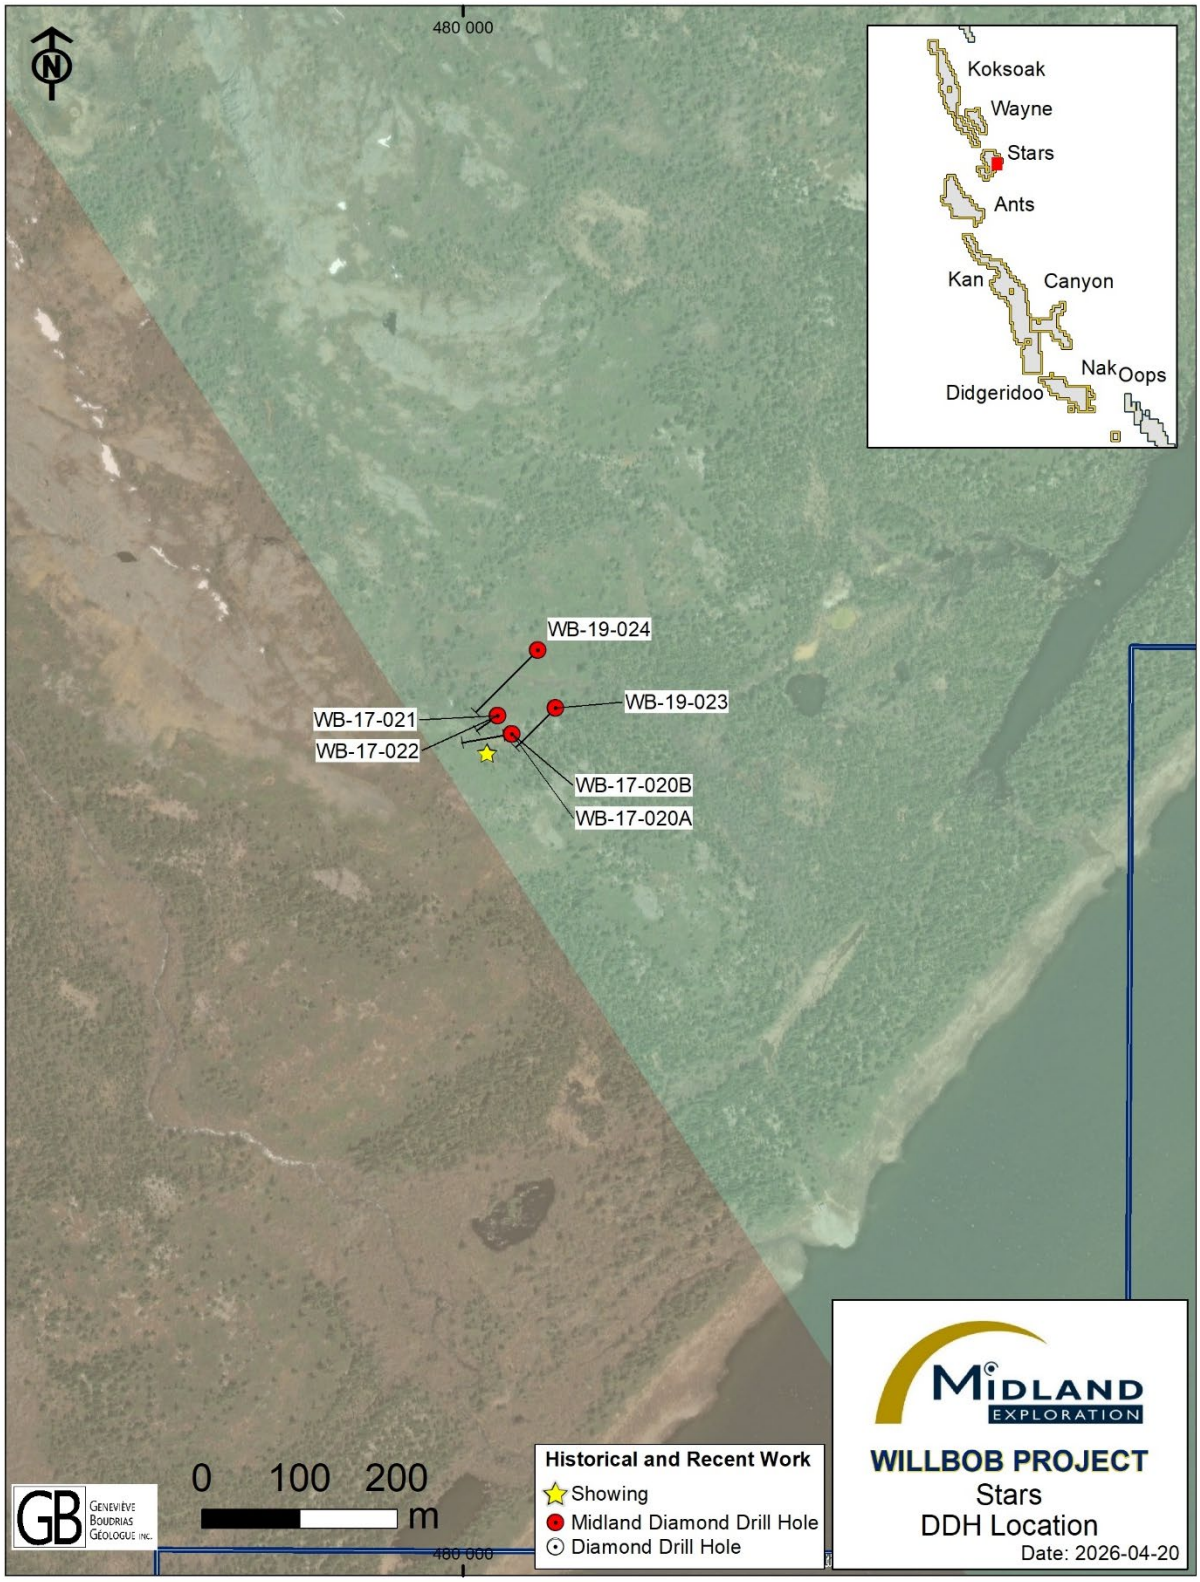

Figure 30. 2016-2017 Midland DDH location – Stars Project.

10.2 2019 drilling campaign

A total of eleven (11) holes were drilled (WB-19-23 @ WB-19-33) (**Table 7**) on Ants (**Figure 31**) and Stars (**Figure 30**) showings for a total of 1,141.5 meters. The best results are (**Table 8**):

- Ants (ddh): 1.81 g/t Au over 12.06 m, including 2.99 g/t Au over 4.56 m in hole WB-19-33, 2.09 g/t Au over 6.01 m, including 4.05 g/t Au over 2.50 m in hole WB-19-26.
- Stars (ddh): 0.13% Cu / 3.30 m, 0.154 g/t Au, 0.16% Cu over 1.25 m.

Hole dips and bearings were measured with a "Reflex" down hole magnetic survey instrument. The NQ size core was logged for geology (among others lithology, alteration, mineralization and structural data), core recovery and RQD were measured. Recoveries were excellent, being predominantly at or near, 100%.

10.3 2016-2018 KAN Osisko drilling campaign

Between 2015-2019, Osisko conducted various types of exploration work on the Kan Project, including several drilling campaigns. The coordinates and characteristics of the drill holes are presented in **Table 9** and the best assays intervals in **Table 10.** The locations of the Osisko drill holes are shown in **Figure 32**.

11 SAMPLE PREPARATION, ANALYSIS AND SECURITY (ITEM 11)

The author believes that the sample preparation, analysis and security protocols for previous prospecting surveys, soil surveys and drill programs followed generally accepted industry standards at that time. Several historical data points have been validated (or refuted) in the field, the overall historical results are of sufficient quality for exploration purposes.

Procedural techniques and sampling done by Midland appear to have employed secure sample data collection and handling procedures consistent with best practice. The author is satisfied that correct collection techniques were used, sufficient chain-of-custody procedures were followed, and that appropriate chemical analyses were performed for the mineralization identified.

2019
All exploration activities on the Willbob Project were coordinated from Kuujjuaq. As the community is not connected by road to southern Québec, the transportation of samples requires air shipment. Midland Exploration ships all samples from Kuujjuaq to the ALS laboratory in Val-d'Or using Canada Post. Samples are securely packaged in identified rice bags, registered at the Canada Post office in Kuujjuaq, and transported by air. This shipping procedure has proven to be efficient and reliable throughout the exploration programs, with no reported loss of samples.

11.1 Sample preparation

2019

All work performed on the Willbob Project was operated from Kuujjuaq. As this village is not connected by road to the southern villages and cities, the shipping of the samples is a concern. Midland Exploration uses Canada Post for the shipping of all the samples from Kuujjuaq to the ALS laboratory in Val-d'Or. Samples are put in identified rice bags and are shipped by plane after registration at the Canada Post office in Kuujjuaq. This method has proven to be quick and provides good quality, considering that no sample was ever lost.

11.1.1 Rock Sampling

2016-2017
Midland Exploration uses Canada Post for the shipping of all the samples from Kuujjuaq to the Activation Laboratories LTD. in Val-d'Or. Samples are put in identified rice bags and are shipped by plane after registration at the Canada Post office in Kuujjuaq. This method has proven to be quick and provides good quality, considering that no sample was ever lost. Details for the assay methods can be found at ActLabs website (*https://actlabs.com/*).

2019
Grab samples collected on the field are prepared with a hammer and are put in a sterile plastic bag identified with an ActLabs tag number. The field geologist notes the GPS coordinate, writes a description and takes photos for each collected sample. In 2025, all grab samples were analyzed for gold and PGE (1C-OES). Also, base metals are assayed by an ultra-trace method ICP-MS after a 4-acid digestion (UT-4).

11.1.2 Channel Sampling

Channel samples were cut with a diamond blade portable cutting saw. A double line was sewed to collect the sample, and a perpendicular line was cut to delimit each sample. All samples were described and photographed by a field geologist and put into a sterile plastic bag with an ALS tag number. Channel samples were analyzed for gold (Au-AA23 and Au-SCR21) and base metals (ME-ICP61). As no channel samples returned values over 5 g/t Au in 2019, no gravimetric method has been used.

11.1.3 Soil Sampling

The sedimentary material was collected with a shovel and put into a paper bag, itself put in a plastic bag to prevent contamination. For shipping, the soil samples were put in rice bags apart from the rock samples.

11.1.4 Drill Hole Core Sampling

2019
After the drilling on the field, the core boxes were shipped by helicopter to the core facilities located at Kuujjuaq. Core sampling was executed, following a constant method. First, the geologist identified the selected samples on the core at chosen intervals (minimum 0.5 metre and maximum 1.5 metres). Then, the core boxes were carried to the cutting tent, where a specialized technician split the core in half with a diamond cutting saw. The technician carefully put the same split side of the core in a sterile plastic bag with an ALS tag number. Each plastic bag was closed with a tie wrap. Finally, the plastic bags were put in identified rice bags in a secure location waiting to be shipped by plane via Canada Post, to the Val-d'Or laboratory.

11.2 Analysis Methods

All analyses were performed by ALS Minerals. Samples were first shipped to the laboratory in Val-d'Or, Québec where they performed the sample preparation according to the PREP-31 protocol. Samples were crushed until up to 70% of their particles became smaller than 2mm. Then, 250 grams of every crushed rock was sprayed until up to 85% of it became smaller than 75 microns. Then, ALS Minerals dispatched most of the samples to their laboratory in North Vancouver for the remaining analysis procedures.

ALS Minerals global quality program includes internal and external inter-laboratory test programs and regularly scheduled internal audits that meet all requirements of ISO/IEC 17025:2017 and ISO 9001:2015. Details for the assay methods can be found at ALS Minerals web site.

11.3 Quality Control and Quality Assurance Monitoring (QA/QC)

The QA/QC assessment addresses three key aspects of analytical protocols: contamination, accuracy, and precision, as evaluated through field blanks, analytical blanks, certified reference materials (CRMs), and routine samples submitted to the laboratory. Internal laboratory QA/QC results were not considered in this section.

Quality control (QC) samples were inserted by Midland to validate the gold results from the laboratory. Blank samples were used to monitor possible contamination. Standards were inserted to ensure instrumental accuracy and precision from the laboratory. During grab, channel and core sampling, Midland inserted a QC sample every 20 samples with alternating blanks and standards. All quality control samples were analyzed for gold by fire assay with an atomic absorption finish (Au-AA23). Also, for each core sample, 100 samples, Ni-Co used one or two (1 or 2) standards, five (5) blanks, three (3) pulp duplicates and one (1) pulp. A total of 24 blanks, 23 standards and 25 pulps.

The Author believes that the sample preparation, analysis, security and QA/QC procedures used are adequate for the purpose of this report and the accuracy and quality of assays used in this report are confirmed. The Author did not visit the laboratory cited above but they have a reliable industry reputation, and work was completed in a professional manner.

12 DATA VERIFICATION (ITEM 12)

12.1 Data verification procedures

- Historical Data
    - Part of the historical information used in this report was derived mainly from documents prepared prior to the implementation of National Instrument 43-101 ("NI 43-101") Standards of Disclosure for Mineral Projects in Canada. The available information regarding sample preparation, analytical methods, and security procedures for the historical work described in the reviewed documents is not always complete. The Author reviewed and validated selected data from available historical reports.
- Recent acquisition of Kan Property (Kan Block) - Osisko
    - Based on the information provided in recent statutory documents from past owner, Osisko, the sampling procedures and analytical work appear to have been conducted in accordance with the standards applicable at the time and are considered acceptable by current standards.
        - The Author reviewed and independently verified the significant mineralized intervals from the Osisko and Midland drilling programs presented in the tables of this Report. The verification included recalculation of reported assay intervals using the original assay certificates and drill logs available to the Author.

          ↳ One (1) certificate appears to be missing: VO18163676
        - Overall, only two (2) intervals differ between the reported intervals and the Author's recalculated intervals. This discrepancy may be attributable to a missing assay certificate or a duplicate certificate in the available documentation.

↳ FAU-16-009	1.21 g/t Au / 8 m	(reported result)
	1.06 g/t Au / 8 m	(recalculated)
↳ OSK-KAN-18-027	4.22 g/t Au / 5 m	(reported result)
	4.04 g/t Au / 5 m	(recalculated)

- Midland works
    - Analytical results from the 2017–2018 and 2019 drilling programs were verified against the original certificates of analysis and compared with the logs and analytical data contained in the database provided by Midland. Selected significant mineralized core intervals were also reviewed at the core storage facilities.
        - Overall, only one (1) interval result differs between the reported interval and the recalculated interval. This discrepancy may be attributable to a missing assay certificate or a duplicate certificate in the available documentation.

↳ WB-17-011	2.23 g/t Au / 1.3 m	(reported result)
	2.18 g/t Au / 1.3 m	(recalculated)

    - In the author's opinion the field prospecting procedures, drilling program and sampling protocol, preparation and analytical procedures are adequate for a drilling stage exploration project.

12.2 Field visit

- The field visit was carried out by Geneviève Boudrias, geo., M.Sc. of Geneviève Boudrias geologist inc., between June 6 and June 14, 2026, for a total of 9 days.

- During these days, the Kuujuuaq core shack, the Old Osisko Kan Camp and its core shack and, several showings on different Blocks were visited.
- The different showings and area visited are listed on the Section 2.4 – Field Visit.
- The Author has not independently verified any sample from the Property.

13 MINERAL PROCESSING AND METALLURGICAL TESTING (ITEM 13)

No Mineral Processing and Metallurgical Testing has been carried out on the Property.

14 MINERAL RESSOURCES ESTIMATES (ITEM 14)

No mineral Resource and Mineral Reserve estimates were realized by Midland.

15 ITEMS 15 to 22

Not applicable.

23 ADJACENT PROPERTIES (ITEM 23)

The main adjacent properties are located near and adjacent to the Koksoak and Stars Blocks. The principal adjacent property is owned by a company number, 14259254 Canada Inc. The other properties are owned by Entreprises minières Globex Inc., Contigo Resources Ltd and Critical Minerals Properties. Adjacent to the KAN-Canyon Block, at its northern edge, Glencore Canada holds a few EER. The EER shown in gray are held by prospectors (Figure 33).

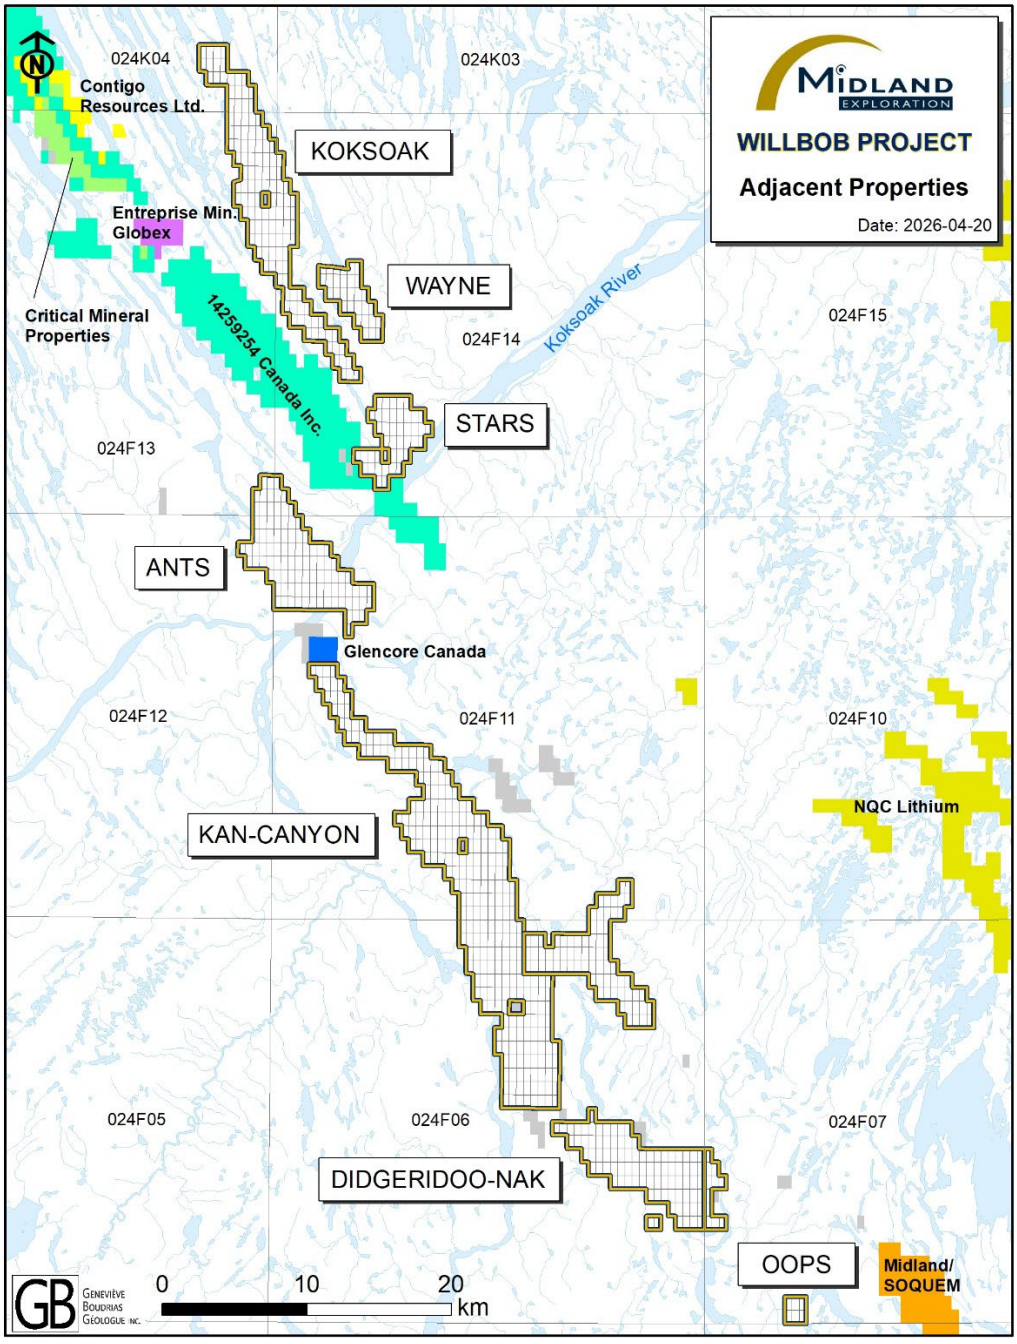

Figure 33. Adjacent properties.

24 OTHER RELEVANT DATA AND INFORMATION (ITEM 24)

To the best of the author's knowledge, all relevant information has been included in other sections of this report.

25 INTERPRETATION AND CONCLUSIONS (ITEM 25)

Exploration work completed on the Willbob Property between 2014 and 2025 has significantly improved the geological understanding of the project and demonstrated the presence of a widespread gold-bearing hydrothermal system distributed over several prospective structural corridors. Systematic prospecting, geological mapping, channel sampling, trenching, geophysical surveys, soil geochemistry and diamond drilling have resulted in the identification of numerous new gold showings and the delineation of several mineralized targets.

Among the various occurrences, the **Ants** and **Didgeridoo** showings represent the most advanced targets. Channel sampling at Ants returned significant gold intercepts, including **1.78 g/t Au over 23.3 m**, with subsequent drilling confirming the continuity of the mineralized zone at depth (e.g., **1.81 g/t Au over 12.06 m** and **2.09 g/t Au over 6.01 m**). At Didgeridoo, channel sampling returned **2.30 g/t Au over 8.95 m**, confirming the presence of a laterally continuous mineralized structure. Several other showings, including Golden Tooth, Lafrance, Polar Bear, Sunshine, Canyon and NAK, have returned locally significant gold values from grab, channel or drill samples, highlighting the district-scale exploration potential of the property.

The discovery of more than twenty new mineralized showings since 2016 demonstrates that the property remains underexplored despite extensive exploration efforts. Recent work completed in 2024 and 2025 further expanded the mineralized footprint through the acquisition of the Kan Property and the identification of new high-grade grab sample results, particularly in the Canyon area, where assays up to **39.5 g/t Au** were obtained. While several historical showings were not successfully replicated during recent prospecting, the overall exploration results continue to support the presence of multiple mineralized systems requiring additional evaluation.

To date, exploration has identified several gold occurrences with encouraging surface and subsurface results; however, drilling has been limited to selected targets and some adjacent areas. The distribution of mineralization, the presence of multiple favorable host lithologies and structures, and the continued generation of new exploration targets indicate that the Willbob Property remains highly prospective for the discovery of additional gold mineralization. Further systematic exploration, including detailed geological mapping, geochemical surveys, geophysical interpretation and follow-up diamond drilling on the most promising targets, is warranted.

26 RECOMMENDATIONS (ITEM 26)

Complete the database with the DDH and channel over the Koksoak Block – Noranda.

Based on the exploration results obtained to date, focus on the **Ants** showing, where channel sampling and diamond drilling have demonstrated continuity of gold mineralization from surface to depth should be more explore. Additional step-out and infill diamond drilling is recommended to define the extent of the mineralized zone both along strike and down dip and improve the geological model.

Follow-up work is also recommended on the **Didgeridoo** showing, where channel sampling has outlined a broad mineralized interval, but drilling remains limited. Additional drilling should test the continuity of the mineralized structure at depth and along strike.

The high-grade mineralization obtained in the **Canyon** area, including grab samples grading up to **39.5 g/t Au**, warrants systematic follow-up consisting of detailed geological mapping, trenching where feasible, channel sampling, and geophysical surveys to identify drill targets. Similar follow-up prospecting should be completed on the **NAK** area, where encouraging gold values were obtained from sulphide-bearing quartz veins and altered gabbro.

Numerous other showings, including **Golden Tooth, Lafrance, Polar Bear, Sunshine, Wayne, Alias, and Kuurrok**, remain incompletely tested. Additional prospecting, detailed mapping, structural analysis, and selective channel sampling are recommended to refine drill targets.

Recommended Work Program

Drilling and Prospection	3,100,000.00$
Airborne geophysical survey – 100 m Over Digeridoo and Ants Blocks	100,000.00$
TOTAL	3,200,000.00$

CERTIFICATE OF ANALYSIS

15 Rock samples were submitted for analysis.

The following analytical package(s) were requested:		Testing Date:
1C-OES	QOP PGE-OES (Fire Assay ICPOES)	2025-09-16 15:16:14
8-4 Acid Total Digestion	QOP Total Assay (Code 8-4 Acid Total Digestion Assays)	2025-09-21 11:24:26
UT-4	QOP Total/QOP Ultratrace- 4acid Digest (Total Digestion ICPOES/ICPMS)	2025-09-11 13:15:22

REPORT **A25-11126**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Values which exceed the upper limit should be assayed for accurate numbers.

CERTIFICATE OF ANALYSIS

124 Core samples were submitted for analysis.

The following analytical package(s) were requested:		Testing Date:
1A2-Val dOr	QOP AA-Au (Au - Fire Assay AA)	2024-07-08 10:15:43
1A3-Val dOr	QOP AA-Au (Au - Fire Assay Gravimetric)	2024-07-11 12:33:16

REPORT **A24-06953**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

If value exceeds upper limit we recommend reassay by fire assay gravimetric-Code 1A3

Total includes all elements in % oxide to the left of total.

Values which exceed the upper limit should be assayed for accurate numbers.

REPORT **A24-06951**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Elements which exceed the upper limits should be analyzed by assay techniques. Some elements are reported by multiple techniques. These are indicated by MULT.

Refer to the Scope of Accreditation for information on accredited elements.

Projet: WILLBOB PROJECT (WB)

Ce rapport s'applique aux 43 échantillons de carotte forage soumis à notre laboratoire de Val d'Or, QC, Canada le 25-SEPT-2019.

Les résultats sont transmis à:

MARIO MASSON	LOUIS-PHILIPPE RICHARD	SYLVAIN TRÉPANIER

PRÉPARATION ÉCHANTILLONS

CODE ALS	DESCRIPTION
WEI-21	Poids échantillon reçu
LOG-21	Entrée échantillon - Code barre client
DRY-22	Séchage - Temp. max. 60 C
CRU-32	Granulation 90 % <2 mm
SPL-21	Échant. fractionné - div. riffles
PUL-32	Pulvériser 1 000 g à 85 % < 75 um
CRU-QC	Test concassage QC
PUL-QC	Test concassage QC

PROCÉDURES ANALYTIQUES

CODE ALS	DESCRIPTION	INSTRUMENT
ME-ICP06	Roche entière - ICP-AES	ICP-AES
OA-GRA05	Perte par calcination à 1 000 C	WST-SEQ
ME-MS81	Fusion Lithium Borate ICP-MS	ICP-MS
TOT-ICP06		

Ce rapport est final et remplace tout autre rapport préliminaire portant ce numéro de certificat. Les résultats s'appliquent aux échantillons soumis. Toutes les pages de ce rapport ont été vérifiées et approuvées avant publication.

CERTIFICATE OF ANALYSIS

128 Lake Sediments samples were submitted for analysis.

The following analytical package(s) were requested: Code 2A-15g Humus INAA(INAAGEO)

Code UT-1-0.5g Aqua Regia ICP/MS

REPORT **A17-11783 (i)**

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

Assays are recommended for values above the upper limit. The Au from AR-MS is only semi-quantitative. For accurate Au data, fire assay is recommended.
